**Modification to the accepted manuscript EGUSPHERE-2022-1090 titled
“Temporal and spatial evolution of bottom-water hypoxia in the St Lawrence
Estuary and Gulf of St Lawrence”**

Dear editor,

We would like to bring to your attention a modification we would like to apply to the manuscript, following a comment from the typesetting team. We would like to modify the “27.25 sigma-tee” in the following sentence to “1027.25 kg m⁻³”:

Whereas the first observations of hypoxic waters were constrained to the bottom of the water column, between 275 and 350 m depth (below the 27.25 sigma-tee isopycnal), the hypoxic layer now reaches deeper (as it expands spatially to deeper sections of the Laurentian Channel) and shallower (up to 200 m, Fig. 3).

We believe that this modification will make this statement more clear.

Sincerely,

Mathilde Jutras
