1 Table of contents

1. Figures S1 to S3
2. Html interactive file showing Empirical distribution function of interpeak timescales [day] (ecdf_interpeak_times.html)

2 Introduction

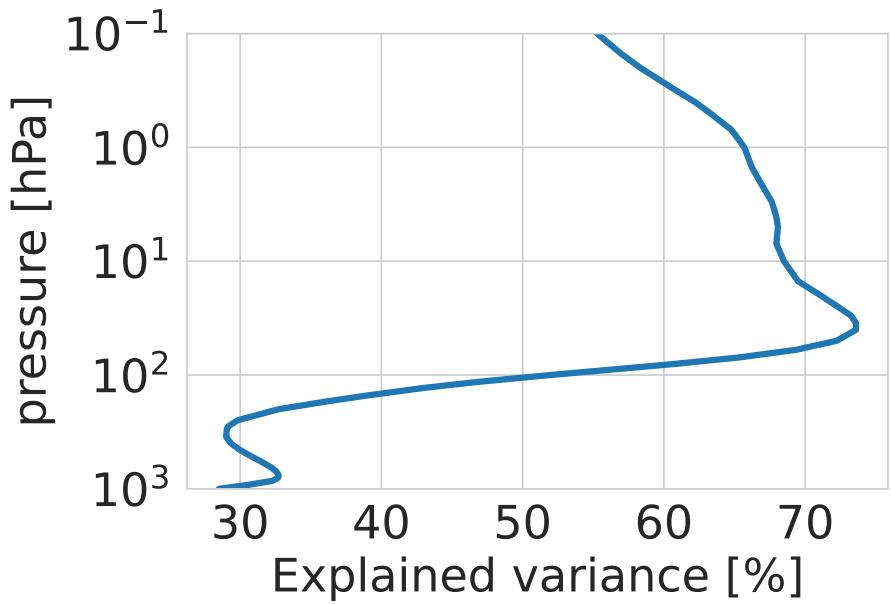

Figure S1. Explained variance [%] of Northern Annular Mode time series.

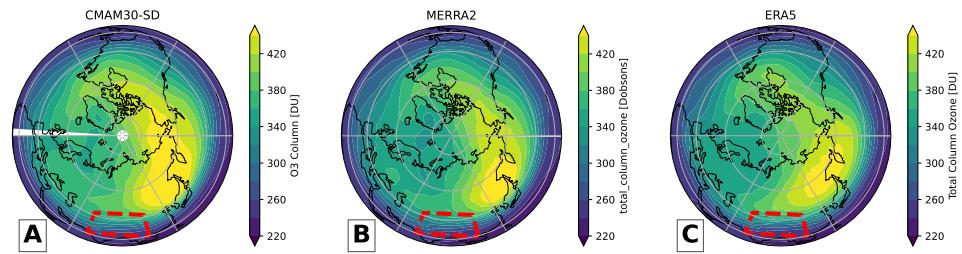

Figure S2. Composites in absolute values documenting total column ozone [DU] in CMAM30-SD (**A**), MERRA2 (**B**), and ERA5 (**C**), respectively. The red box represents the Himalaya ($70\text{--}102.5^{\circ}\text{E}$ and $20\text{--}40^{\circ}\text{N}$) hotspot.

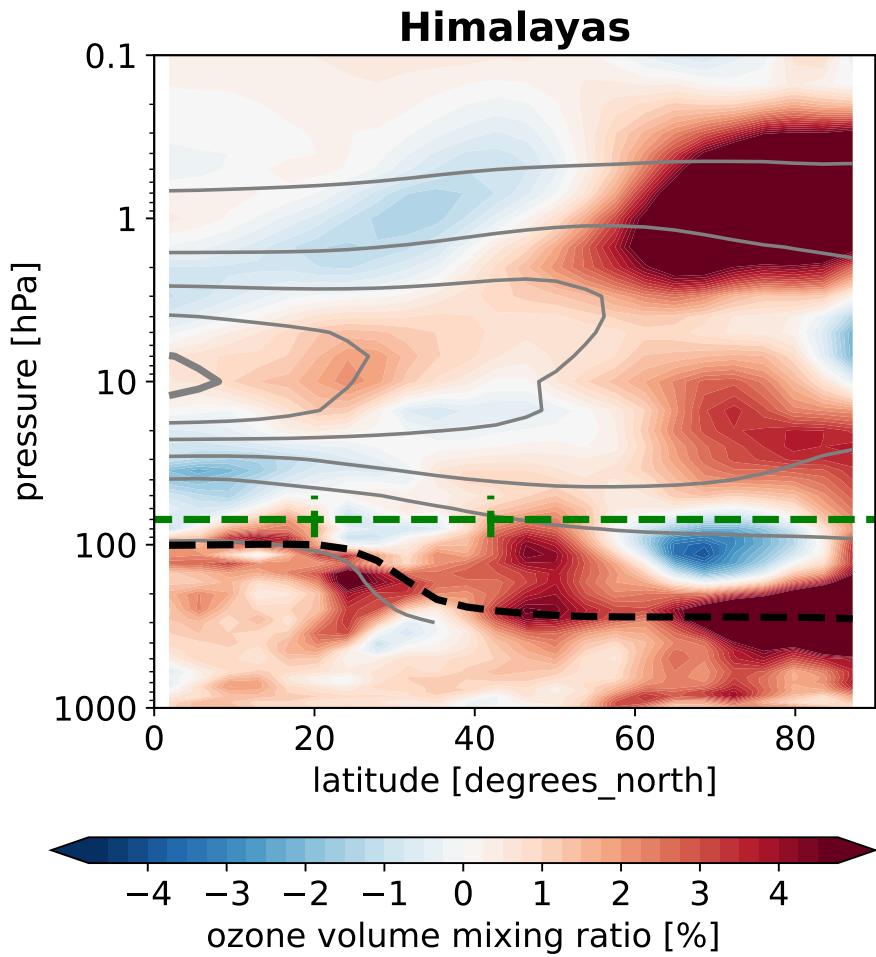

Figure S3. Ozone anomalies (units: %, colored regions) and absolute (gray contour levels: $1 \cdot 10^{-7}, 2 \cdot 10^{-6}, 4 \cdot 10^{-6}, 6 \cdot 10^{-6}, 8 \cdot 10^{-6}, 1 \cdot 10^{-5}$ mole/mole) composite average at lag=0 representing the Himalayas. Green horizontal and vertical lines represent regions of a particular GW hotspot. Black dashed line corresponds to tropopause pressure level of respective composite.
