27

28 Abstract:

29 The first part of this article gives an overview of influential comics and graphic novels on  
30 paleontological themes from the last twelve decades. Through different forms of  
31 representation and narration, both clichés and the latest findings from paleontological  
32 research are presented in comics in an entertaining way for a broad audience. As a result,  
33 comics are often chroniclers of 20<sup>th</sup> century scientific history and contemporary paleoart.  
34 The second part of this article deals with the development of the bilingual graphic novel  
35 *EUROPASAURUS - Life on Jurassic Islands*, which communicates knowledge from

36 universities as well as museums to the public. This non-verbal comic presents the results of  
37 a paleontological research project on a Late Jurassic terrestrial biota from northern Germany  
38 in both a scientifically accurate as well as an easily understandable way, based on the way  
39 of life of various organisms and their habitats. Insights into the creative process, the  
40 perception of the book by the public, and ideas on how to raise public awareness of such a  
41 project are discussed.

42

## 43 1 Introduction

44 The communication of scientific research via contemporary and creative ways is becoming  
45 more and more important for research institutions. Paleontological topics are often met with  
46 special interest by the public, especially when it comes to vertebrate paleontology. From our  
47 experience, maximum attention is paid to dinosaur research, which often reaches an  
48 international distribution in the media, depending on the momentary situation on the global  
49 news market. However, all press releases and subsequent press articles share one  
50 disadvantage—their short-lived nature. After a maximum of several days, the reports are no  
51 longer present in the media and will be quickly forgotten. Hence, this type of knowledge  
52 transfer does not appear to be particularly sustainable.

53 Books on the other hand, are long-lasting and can accompany us our whole lifetime.

54 Unfortunately, text-heavy popular science books do not reach all groups in our society  
55 equally (i.e., children from socially disadvantaged backgrounds) due to partially higher  
56 barriers of accessibility. Easily accessible formats such as comics and graphic novels offer  
57 opportunities to transmit science into possibly more neglected parts of our society.

58 This paper, consisting of two parts, addresses this issue with an example from the field of  
59 paleontology. The first part provides an overview of the historical development of  
60 paleontology-themed comics and graphic novels, the influence of paleoart in this genre, and  
61 the potential of graphic novels in transmitting science into the public. The second part  
62 focuses on the dinosaur-related graphic novel *EUROPASAURUS - Life on Jurassic Islands*  
63 as an example. We explain our motivation for its creation, the production process, and our  
64 strategy for advertising it, with the goal of encouraging other scientists to explain their  
65 research results to the public in a similar fashion.

66

## 67 1.1 Paleontology within popular science books

68 Paleontological discoveries became known to a wider audience in the mid-19<sup>th</sup> century, due  
69 to public lectures, the first ‘dinomania’ following the creation of the Crystal Palace life-sized  
70 reconstructions of dinosaurs (Manucci and Romano, 2022), and the new spectacular  
71 dinosaur finds from the United States. Since then, manifold books, articles, and even  
72 collecting cards presenting the results and summaries of contemporary knowledge have  
73 been published. In the beginning, these publications were primarily addressed to an adult  
74 and educated readership (e.g., Flammarion, 1886; Knipe, 1905; Andrews, 1926; Bölsche,  
75 1931; Knight, 1935; Augusta, 1942), but by the 1950’s younger readers were also reached  
76 by a wide range of age-appropriate and lavishly illustrated books (e.g. Scheele, 1958;  
77 Watson, 1960; D’Ami, 1973; Norman, 1985). Nowadays, such children books dominate the  
78 market of non-professional paleontological publications, often resulting in a marginalization  
79 of dinosaur topics as ‘kids’ stuff’ in the view of the general public (Liston, 2010). However,  
80 there were always outstanding paleontological popular science books for adult and mixed  
81 audiences as well (e.g., Augusta and Burian, 1956; Spinar, 1972; Stout, 1981; Cox et al.,  
82 1988; Norman, 1988; Czerkas and Czerkas, 1990; Holtz, 2007). All these books share a  
83 relatively text-intensive style, although many of them qualify as so-called ‘coffee table’ books  
84 with a variety of large-sized colorful illustrations. Unfortunately, the information contained on  
85 specific paleontological topics is often at least slightly outdated by the time of release,  
86 especially in children’s books, a market where it is often not seen as necessary by  
87 publishers to be up-to-date. New ideas and paradigms in paleontological research take  
88 years to reach a non-academic audience and even decades to determine the perception of  
89 the general public on that topic (Ross et al., 2013). However, communication on the latest  
90 paleontological knowledge can be realized most quickly and effectively by a medium  
91 specifically aimed at a predominantly young audience (Liston, 2010)—the comic strip.  
92

## 93 1.2 Influential paleoart

94 Paleoart is an art genre that depicts paleontological subjects realistically or artistically,  
95 reconstructing extinct biota and their habitats based on scientific data. Artists who strive to  
96 reconstruct prehistoric organisms and/or habitats as accurately as possible, often in close  
97 collaboration with paleontologists and other specialists (Germann, 1943), are so-called  
98 paleoartists (Hallett, 1987, Janzen, 2020). Although existing for about 200 years (Lescaze,  
99 2017), paleoart still struggles for its reputation to be regarded as ‘real’ art compared to the  
100 ‘classic’ genres (Janzen, 2020). In recent decades, there have been many approaches to

101 appreciating, classifying, and assessing paleoart and paleoartists (e.g., Czerkas and Olsen,  
102 1987, Lescaze, 2017, Hübner, 2020, Janzen, 2020, Manucci and Romano, 2022), even  
103 including instructions for making one's own attempts (Witton, 2018). Paleoart is a crucial link  
104 between paleontology and public awareness because paleoartists illustrate paleontological  
105 theories in their life restorations (Murray, 1997; Spindler, 2020).

106 Therefore, it is not surprising that contemporary paleoart has repeatedly served as a  
107 template for the depiction of prehistoric life in comics since the early 20th century. Without  
108 any paleontological research of their own, most comic authors and illustrators relied directly  
109 on preexisting visual ideas of the subject. Although often exaggerated in their presentation,  
110 the original artwork can often still be recognized in the animal contours, body postures, and  
111 sometimes even color patterns (Fig. 1). Many panel drawings were almost exact copies of  
112 their academic originals, which were recycled again and again. However, subsequent strips  
113 also independently aligned themselves with the prevailing scientific view and reconstruction  
114 (Murray, 1993, Liston, 2010). This transformation of contemporary paleoart and its  
115 underlying paleontological ideas into panels makes comics chroniclers of advances in  
116 paleontology. Many dinosaur comics thus accurately reflect contemporary paleoart and the  
117 paleontological paradigms of the time. In particular, the paleoart of the so-called 'Classic Era'  
118 from 1890 to the late 1960's (Witton, 2018) generated manifold inspiration and direct  
119 templates for comics. During this period a triumvirate of paleoartists, the preeminent  
120 authorities in the field, provided the 'graphical' fuel for memorable prehistoric worlds and  
121 impressive archaic antagonists. Their paleoart was responsible for establishing the  
122 standards of what dinosaurs should look like at the time, inspiring generations for how  
123 dinosaurs were to be portrayed. They were so widespread and well-known in cultural  
124 memory through books, comics and movies that even today many people are familiar with  
125 their work (Gould, 1993; Czerkas, 2006; Ross et al., 2013, Janzen, 2020), even though they  
126 may never have heard of their names.

127 The first of these most influential paleoartists was Charles Robert Knight (1874–1953).  
128 Knight was a classically trained artist who specialized in animal paintings. He is probably  
129 best known for his collaborative work on reconstructing extinct organisms with paleontologist  
130 Henry Fairfield Osborn at the American Museum of Natural History in New York (Paul,  
131 1996). He also reconstructed many fossil taxa described by the rival paleontologists Othniel  
132 Charles Marsh and Edward Drinker Cope. Knight almost single-handedly established the  
133 field of accurate artistic reconstruction of prehistoric life in public perception (Gould, 2001;  
134 Bisette, 2003) and can be regarded as the first internationally renowned paleoartist (Witton,  
135 2020). Part of his legacy is his rigorous approach to reconstructing extinct animals, providing

136 a guideline for subsequent generations (Knight, 1947). While his dinosaur reconstructions  
137 are outdated today, many of his paintings and drawings of mammals still hold up to modern  
138 standards. In two of the most famous and widely used templates of paleontological  
139 reconstructions, Knight established *Brontosaurus* as a semiaquatic behemoth and  
140 *Tyrannosaurus* and *Triceratops* as eternal enemies (Knight, 1935). In addition, his  
141 surprisingly dynamic ‘Leaping Laelaps’ as well as numerous other murals and paintings  
142 reproduced in books, periodicals, and journals (e.g. Knight, 1935, 1942, 1946; Czerkas and  
143 Glut, 1982; Czerkas, 2006; Milner, 2012) provided a vast number of templates for prehistoric  
144 lifeforms in comics. For example, the lost worlds with wonders and threats of the early  
145 *Tarzan* and *Turok* series are unmissable testimonials to his work (Fig. 1a).

146 The second member of the triumvirate was Rudolph Zallinger (1919–1995). His contribution  
147 to paleoart still echoes through paleontological history. While in his last year at the Yale  
148 School of Fine Arts in 1942, he was offered to add “some kind of decoration” to a large wall  
149 of the dinosaur hall at the Yale Peabody Museum. After pencil sketches and a preliminary  
150 small-scale painting, or model, in egg tempera, Zallinger worked for three and a half years  
151 on the 33.5 meter long mural *The Age of Reptiles*, a grand narrative of life from the  
152 Devonian to the end of the Cretaceous. The mural was finished in 1947 (Volpe, 2007) but  
153 did not become famous until a few years later, when Life magazine reprinted the  
154 preproduction model as a foldable panorama (Life, 1953). With that, Zallinger’s fresco-like  
155 depictions of prehistoric life became the gold standard for portraying dinosaurs for years to  
156 come. In 1949, Zallinger received the Pulitzer Prize for his mural. He later created more  
157 paleoart for other publications (e.g., Watson, 1960; Zallinger, 1966), but his most influential  
158 work remains *The Age of Reptiles*. In particular, Zallinger’s iconic *Tyrannosaurus* was  
159 frequently used in comic strips and serials until the 1960’s (Fig. 1b). Entire stories, especially  
160 in *Turok*, were graphically based on this single image of a dinosaur in side view.

161 The third cornerstone for the inspiration (and plagiarism, Sadecký, 1982b) of prehistoric  
162 wildlife in countless comics was the Czech artist Zdeněk Burian (1905–1981), who may be  
163 the most influential paleoartist of the mid and late 20<sup>th</sup> century (Reich et al., 2021). His work  
164 shaped public perceptions of prehistoric life like no other (except Knight, depending on the  
165 European or American perspective). Burian achieved this by his extreme productivity (with  
166 some 1,300 images and preliminary sketches on prehistoric subjects; Rostislav Walica, pers.  
167 comm.) and through his appealing, highly detailed images. He began his career as an  
168 illustrator of adventure and science fiction novels (Sadecký, 1982a; Prokop, 2005). As such,  
169 he was not only a master of various media, but also a skilled visual storyteller. Through his  
170 work on novels about mammoth hunters (Štorch, 1937), he came into contact with the

171 paleontologist Josef Augusta and later with other scientists (Walica, 2003; Prokop, 2005).  
172 These fruitful collaborations resulted in several lavishly illustrated large-format books on  
173 evolution and the history of man (e.g., Augusta, 1942; Augusta and Burian, 1956, Spinar,  
174 1972; Wolf, 1977). Despite the Iron Curtain, his works have been translated and exported  
175 worldwide since the 1950's. Producing countless paleoart originals over several decades  
176 (Müller and Walica, 2022), Burian can be considered the legitimate successor of Knight  
177 (Witton, 2020). In comics, his first worldwide book success (*Prehistoric Animals* from 1956)  
178 can be traced precisely to *Turok* #11 in 1958, where copies of his depictions of prehistoric  
179 life started to complement and increasingly replace Knight and Zallinger's templates (Fig.  
180 1c).

181  
182

### 183 1.3 Comics and graphic novels about prehistoric life

184 Comics are a medium that expresses ideas with images. They often consist of sequences of  
185 panels of images and are frequently combined with text or other visual information. Graphic  
186 novels are books made up of comic content. They tell a longer and sometimes more  
187 complex story and are distinct from 'comic books' that consist of comics, periodicals, and  
188 trade paperbacks. Moreover, they represent a successful marketing concept for a form of  
189 publication in which comics gain literary merit through book covers in order to be distributed  
190 by major publishers in bookstores (Abel and Klein, 2016). A discussion of prehistoric topics  
191 in cartoons is beyond the scope of this paper, although this theme and its sometimes even  
192 bidirectional influence on paleontology (e.g., Gary Larson's "thagomizer"; Holtz, 2007) would  
193 merit a review on its own.

194 Like most other comics, strips involving prehistoric creatures are aimed predominately at a  
195 young target audience. The majority of previous and modern comics dealing with dinosaurs  
196 and other prehistoric life serve as pure entertainment. They represent the absolute majority  
197 of dinosaur comics with thousands of stories handling tales from science fiction, fantasy,  
198 horror, mystery, western, or the superhero genre (Glut, 1980). Only a small but diverse niche  
199 uses a different approach; not only providing enjoyable and thrilling stories, but also  
200 contributing to the transfer of scientific knowledge and deepening the paleontological  
201 background beyond the entertainment factor. This type of subtle education of the audience  
202 may be achieved via individual panels with embedded information, via detailed elaborated  
203 scientific content in a comic book style, or via a format in between.

204

205 Dinosaurs and their kin have always been a popular subject in comic strips. Starting as a  
206 recurring inventory of excitement or terror in Sunday newspaper edition stories, extinct  
207 animals later also got leading roles (sometimes as anthropomorphized characters) and even  
208 sequel stories (Glut, 1980; Murray, 1993; Bissette, 2003). They were used in several  
209 contexts, from entertainment to education, with a variety of formats between. The strips  
210 grouped thematically below are a limited selection without any claim to completeness.

211

## 212 Adventure stories

213 The first and foremost use of prehistoric life in comics was—and still is—for the purpose of  
214 pure entertainment without any interest in paleontological education. Prehistoric animals are  
215 shown just as forces of nature. They are necessary to advance the story as villains (or  
216 heroes) or a MacGuffin (an object that is necessary to the plot, but insignificant in itself), and  
217 are merely used to create tension and action (Glut, 1980). The animals are usually depicted  
218 as dangerous, vicious, stupid, carnivorous, and often pose supernaturally large threats for  
219 the human protagonists. Commonly, the prehistoric lifeforms do not survive the encounter  
220 with humans. These strips are essentially not dinosaur comics but comics with dinosaurs  
221 (Bissette, 2003). Three recurring specific settings are widely used (Galle, 1993) to explain  
222 the presence of the prehistoric creatures: 1) lost-world areas, a realm where they survived  
223 until today; 2) other planets, strange worlds with primordial plants and animals; and 3) time  
224 travel, the journey into their time or their retrieval into modern times.

225 The earliest comic reference to dinosaurs is *Prehistoric Peeps* from 1893 (Merkl, 2015), in  
226 which prehistoric humans and dinosaurs satirically reflected and caricatured the present in  
227 anachronistic situations. A subsequent example of more prehistoric encounters is the classic  
228 Saturday newspaper comic strip *Dream of a Rarebit Fiend* by Windsor McCay, where  
229 dinosaurs repeatedly appeared between 1905 and 1913, and were remarkably accurately  
230 drawn by the standards of the time (Merkl, 2015). One of these comic pages (Fig. 2a)  
231 already foreshadowed a topic McCay later reworked in his well-known animated dinosaur  
232 film *Gertie the Dinosaur* in 1914 (Nathan and Crafton, 2013). Another classic newspaper  
233 strip, *Madge, the Magician's Daughter*, also used a diverse dinosaur menagerie already by  
234 1907 (Fig. 2b) to show a museum trip from a surprising new side (Wilson, 2010). A more  
235 serious encounter was depicted in a multiple part Sunday edition of Edgar Rice Burrough's  
236 *Tarzan* by Harold Foster from 1932, where the protagonist met a carnivorous (!) sauropod,  
237 countless pterosaurs, and finally survived the attack of a giant and impressively colorful  
238 *Tyrannosaurus rex* (Fig. 2c; Carlin and Foster, 2013). It took another five years before the  
239 next comic dinosaur appeared. In 1937, *Prince Valiant* faced a sauropod-like swamp-  
240 monster, which he defeated in the end. Tarzan's second encounter with a *T. rex* happened

241 in 1945 in Burne Hogarth's strip, where Tarzan managed to impale the obtrusive carnivore  
242 (Hogarth, 2016). With #4 of the *Tarzan Comic* in 1948, dinosaurs finally became a regular  
243 part of recurring Lost World stories for about 20 years, shaping many subsequent strips in  
244 their representational form and color scheme (Fig. 2d; DuBois and Thompson, 2017). Other  
245 comic serials started to use the potential of prehistoric threats and primordial adventures too,  
246 and prehistoric topics have flourished in countless issues ever since (Murray, 1993; Glut and  
247 Brett-Surman, 1997; Bissette, 2003). To date, nearly every superhero (team) in any  
248 franchise has had its own encounter with members of the Dinosauria or other prehistoric  
249 lifeforms (Glut, 1980). Starting in 1960 in *Star-Spangled War Stories* #90 by DC, US soldiers  
250 were repeatedly confronted with over-sized Mesozoic creatures on countless Pacific islands  
251 during World War II (Fig. 3a). It was not until 1968 that this *War That Time Forgot* ended  
252 after 45 explosive clashes in #137. In the German *Piccolo* comics from the 1950's such as  
253 *Akim, Sohn des Dschungels* [*Akim, Son of the Jungle*], *Sigurd, der ritterliche Held* [*Sigurd,*  
254 *the Knightly Hero*] or *Raka, der Held des Jahres 2000* [*Raka, Hero of the Year 2000*], the  
255 protagonists experienced adventures with most stereotypical dinosaurs on a regular basis  
256 (ComicSelection, 2019). Even in the cataclysmic future world of *Xenozoic Tales* from 1987,  
257 also reprinted under the title *Cadillacs and Dinosaurs*, a variety of marvellous illustrated  
258 prehistoric animals, especially dinosaurs, complicated the postapocalyptic life of the two  
259 main characters for 14 issues (Fig. 3b; Schultz, 2013).

260 However, there are also peaceful encounters with the prehistoric menagerie in thematically  
261 quieter and more child-friendly comic series. In 1957, Donald Duck and his nephews  
262 unintentionally experienced a 'Forbidden Valley' lost world adventure in *Walt Disney's*  
263 *Donald Duck* #54 (Fig. 3c). In 1974, German *Fix und Fax* (#193–199) also visited a colorful  
264 prehistoric setting (inspired by drawings from Bölsche, 1931) without causing collateral  
265 damage among the inhabitants (Fig. 3d; Kieser, 2018). A similar story was told in a short  
266 episode for the protagonist trio Abrafaxe in *Mosaik* #216–217, where they accidentally time  
267 travelled to the Cretaceous (Fig. 4a; Schleiter, 2011). In series such as *The Adventures of*  
268 *Tintin* (Hergé, 1947) and even *Asterix* (Fig. 4b; Ferri and Conrad, 2021), dinosaurs appeared  
269 as MacGuffins instead of antagonists. In *Calvin and Hobbes*, prehistoric worlds are regular  
270 retreats of fantasy from the dreariness of everyday life (Watterson, 2012).

271

## 272 Adventure stories supported by educational information

273 Besides pure adventure stories with prehistoric inventories, more educational approaches  
274 have been realized too. The Dell serial *Turok, Son of Stone* also chose a lost world setting.  
275 Starting in 1954, it became the longest running dinosaur serial with altogether 131 issues  
276 until 1982. Two native Americans, Turok and his young companion Andar, discover a lost  
277 valley full of largely-varied, preferably dangerous ancient lifeforms. While all stories dealt

278 with their unsuccessful attempts to leave this inhospitable place, they met (and killed)  
279 countless prehistoric creatures (Fig. 5a). In contrast to *Tarzan*, where the dinosaurs were  
280 only a means for entertainment, the *Turok* authors provided additional information about  
281 prehistoric life to the reader. Supplementary pages were included in every issue, detached  
282 from the *Turok* universe. As of 1956, text pages about specific animals with illustrations as  
283 headers were included—strongly reminiscent of chocolate trading cards from the first half of  
284 the 20th century (Bölsche, 1916). By 1957, the additional separate short strip *Young Earth*  
285 was established to alternate with the main story in every issue (Fig. 5b), focusing solely on  
286 the prehistoric animals and explaining aspects like animal behavior or evolutionary patterns.  
287 While most of these stories mixed Paleozoic and Mesozoic taxa indiscriminately, they can be  
288 seen as the vanguard of the true dinosaur comics of the future. Similar approaches of  
289 additional brief scientific background information were used in the Dell Movie Classics, such  
290 as #845 (*The Land Unknown* 1957), #1120 (*Dinosaurus!* 1960), and #1145 (*The Lost World*  
291 1960), to supplement the stories in the related films. Another example is the space storyline  
292 of the German Digedags in *Mosaik* between 1961 and 1962 (Hegen, 2004, 2006). For ten  
293 issues, starting with #51, the protagonists investigated several planets with different stages  
294 of earth's evolution (even in the correct evolutionary order) (Fig. 5c), while the back cover in  
295 each issue summarized scientific facts. The same approach, although from another  
296 perspective, was used recently in *Paleocene* by Mike Keesey. Here, we see the world  
297 through the eyes of anthropomorphized lemur-like primates just a decade after the asteroid  
298 event that killed the dinosaurs, leaving behind a devastated world at the dawn of a new era.  
299 While the primates try to survive against avian dinosaurs, the non-avian dinosaurs still exist  
300 as dragons in fairy tales of the elders (Fig. 5d). Concise scientific facts introduce every issue  
301 and provide framework and context for the events.

302

### 303 Adventure stories supported by sophisticated educational information

304 In tradition and as an extension of the *Young Earth's* narrative style, longer stories were  
305 produced with a scientifically more robust background and naturalistic depictions of the  
306 animals and environments. The focus in these modern comics was on the needs,  
307 experiences, but also failures of the dinosaur protagonists. *Paleo* is an anthology of a dozen  
308 different dinosaur stories from the Late Cretaceous in detailed monochrome panels,  
309 highlighting also other animals such as marine reptiles and pterosaurs (Fig. 6a; Lawson,  
310 2016). In contrast, *Tyrannosaurus rex* focused on a feathered tyrannosaurid individual,  
311 Cobald, and its daily struggle to survive and to find a mate in the latest Cretaceous (Fig. 6b;  
312 Rechlin, 2016). Subsequent volumes have extended this concept to other dinosaurs, as well  
313 as the evolution of sharks, whales, and Ice Age mammals (e.g., Rechlin, 2018, 2019).

314

315 Self-narrative storyboards

316 Another approach is text-reduced visual storytelling, similar to a sophisticated storyboard.  
317 This comic format is used in *Age of Reptiles* by Dark Horse Comics (Delgado, 2011, 2015),  
318 which depicts the fate of several dinosaurs in four stories: *Tribal Warfare* from 1993 featured  
319 a conflict between a *Tyrannosaurus* family and a pack of *Deinonychus*, *The Hunt* from 1996  
320 followed a vendetta involving an *Allosaurus* and a group of chameleon-like *Ceratosaurus*,  
321 *The Journey* from 2009 showed the annual migration of various Cretaceous dinosaurs herds  
322 to new feeding grounds, and *Ancient Egyptians* from 2015 depicted a brief period in the life  
323 of a *Spinosaurus*. While the first two stories partially anthropomorphized their non-human  
324 protagonists in their overly violent action and motivation, subsequent stories were told closer  
325 to the tradition of animal documentaries, attempting to avoid uncharacteristic animal  
326 behavior and interactions. The paleontological background is not explained further. Instead,  
327 the reader is challenged to extract all information from the colorful dynamic drawings (Fig.  
328 6c). A similar approach was used in *Cretaceous* (Galusha, 2019) which tells the story of a  
329 *Tyrannosaurus* family struggling with a group of marauding *Albertosaurus* and obtrusive  
330 dromaeosaurs of all sizes. The pace of the story is further driven by the creative and  
331 dynamic use of panels (Fig. 6d). Another text-reduced *Tyrannosaurus* adventure is *Love:*  
332 *The Dinosaur*, where the vicious lead character interacts with more comic relief dinosaurs to  
333 finally witness the inevitable asteroid impact (Brremaud and Bertolucci, 2017).

334

335 Comic science books

336 Paleontological information has also been conveyed through a direct implementation of  
337 popular science book content in comic style. For example, an adventurous story with  
338 (intrusive) human protagonists can be abandoned in favor of imparting knowledge transfer  
339 through panels with text boxes. Classics Illustrated used this concept twice to present a  
340 volume on paleontological knowledge of its time: in Classics Illustrated issue #19 *The*  
341 *Illustrated Story of Prehistoric Animals* from 1959, and in its successor, Classics Illustrated  
342 Special #167A *Prehistoric World* from 1962 (Fig. 7a). Several chapters present the history of  
343 paleontology, the evolution of life, and the history of humankind in comic book form. In the  
344 comic adaptation of the 1978 French animated series *Once Upon a Time... Man*, the history  
345 of the earth before the appearance of humans was summarized in panels on several pages  
346 in the first volume (Gaudin et al., 2021), together with the series actors as well as the  
347 characteristic time clock (Fig. 7b). More recently, a more reflective account was provided in  
348 *Alpha ...Directions* by Jens Harder, detailing the evolution of life up to the appearance of  
349 humans. *Alpha* used classic iconic depictions from books, articles, movies, TV shows, and  
350 also other comics to summarize concepts and mechanisms for evolution as well as the

351 development of life according to current understanding in collages of science and pop  
352 culture. Short accompanying sentences articulate the main idea or message of each collage.  
353 (Fig. 7c; Harder 2010). Another ambitious science comic, *Evolution: The Story of Life on*  
354 *Earth* (Hosler et al., 2011), provides insights into evolutionary processes on Earth, including  
355 paleontological topics, through black and white panels. The content covers highly complex  
356 processes in an understandable way through entertaining one-liners of extant and fossil  
357 organisms, presented and explained by an alien scientist in his holographic museum. In  
358 *Science Comics: Dinosaurs* (Reed and Flood, 2016), the narrative structure follows the  
359 history of scientific discoveries. The scientists portrayed, and sometimes even the dinosaurs,  
360 were given speech bubbles to convey relevant information. In the *Earth Before Us* trilogy by  
361 Abby Howard (Howard, 2017, 2018, 2019), we follow a scientist and a young girl through the  
362 geological eras. Readers get information about evolution, experience the variety and beauty  
363 of these lost worlds, and learn about the pronunciation of Latin names (Fig. 7d). Even a  
364 glossary is provided. While most information is conveyed by the protagonists in speech  
365 bubbles, some pages depicting animals in a particular ecosystem resemble puzzle pictures.

366

#### 367 Genre potpourri

368 The previously mentioned comic styles can also be mixed (i.e., a documentary-style  
369 narrative storyline with supporting text boxes supplemented by textbook-style background  
370 information). Marvel's *Dinosaurs, a Celebration*, a four-issue series on stand-alone dinosaur  
371 comic narratives by various artists and authors was first published in 1992. Each issue  
372 contains four short, visually varied stories about different taxa, accompanied by blocks of  
373 descriptive text, as well as textbook-style pages on different paleobiological topics  
374 alternating with the stories. *Stephen R. Bissette's Tyrant* from 1994 tells the story of a  
375 breeding *Tyrannosaurus* and an egg-hunting *Chirostenotes* in four issues (Bissette, 1994),  
376 with ultimate consequences for one of them (Fig. 8a). The monochrome story focuses on  
377 these protagonists, but also highlights other creatures such as insects, spiders or turtles of  
378 the Cretaceous ecosystem. Finally, an entire volume is devoted to the development of the  
379 embryo in the egg, which is probably unique in its complexity in the comic field. Scientific  
380 information about the animals and their behavior is provided in an appendix to each issue.  
381 The book series *Dinosaurs* (Bacchin and Signore, 2008) devotes each of the six volumes to  
382 a particular Mesozoic ecosystem centered on distinct dinosaurs: *Plateosaurus*,  
383 *Archaeopteryx*, *Allosaurus*, *Scipionyx*, *Argentinosaurus*, and the inevitable *Tyrannosaurus*.  
384 In each volume, about 40 pages of graphic novel (Fig. 8b) are followed by 20 pages of  
385 extensive textbook with detailed background information on the depicted taxa, their  
386 phylogenetic position, size comparisons, as well as general information on dinosaur  
387 evolution and paleontology. Finally, there is *Mimo on the dinosaur trail* (Mazan et al., 2016)

388 about the results of the dinosaur excavation in Angeac-Charente, France. The  
389 ornithomimosaur Mimo and his carcharodontosaur friend Hector face an unknown danger  
390 together. The Cretaceous ecosystem is introduced as this story develops. After the comic  
391 section with text blocks and speech bubbles, making up almost half of the volume, there is  
392 an illustrated outline of the fauna followed by an account in sketchbook form of the real  
393 excavation with explanations of the work steps and an introduction of the human  
394 participants.

395

#### 396 1.4 Graphic novels as a tool for teaching science

397 Today, paleoart is the most commonly used medium to communicate paleontological topics  
398 to the public. It can not only provide ideas about the ecosystems of the past, but it can also  
399 help to increase interest in them (Berta, 2021). Therefore, it is obvious to use this medium of  
400 science communication in the form of a graphic novel. Research institutions address diverse  
401 target groups and educational levels in order to interest a broad audience in their research  
402 activities and findings. In this way, they break down barriers—including invisible ones such  
403 as language barriers—and can offer scientific content in a way that engenders equal  
404 opportunities and self-determined participation (Leidner, 2007; Metzger, 2016). Through this  
405 form of inclusion, very individual levels of receptivity, needs, and knowledge levels are  
406 equally addressed in a format-friendly manner. Interested readers can thus approach  
407 specialized topics from different perspectives. This enables readers to independently  
408 experience content and gain knowledge. Simultaneously, it helps the pursuit for greater  
409 inclusion in our society (Abel and Klein, 2016; Wong et al., 2016; Metzger, 2016).

410

411

412

413 Our sensory nervous system is stimulated by a variety of sensory data. In that process, our  
414 senses automatically and constantly carry out selection processes of incoming information  
415 (Kahlert, 2000). Graphic novels are especially suited to focus our attention on specific  
416 senses. Images, in particular, often show something unexpected and can either complement  
417 or challenge prior knowledge, which in turn can trigger emotions and increase interest.  
418 Books and images can thus be used creatively as didactic material in the classroom. For  
419 example, a graphic novel with a scientific background may serve as a valuable  
420 complementary tool in the classroom, even when not directly related to the curriculum  
421 (Tatalovic, 2009).

422

423 Museum and collection knowledge transfer necessitates creating access to knowledge  
424 through a variety of aesthetic forms of presentation. These forms range from dioramas and  
425 room-filling illustrations to graphic literature such as graphic novels with page-filling images  
426 with little to no text. The latter can increase interest in technical topics as well as improve  
427 reading comprehension (Abel and Klein, 2016; Wong et al., 2016). Moreover, a graphic  
428 novel finds its readership among adults and yet does not exclude children, teens, and  
429 families because very little text comprehension is required (Abel and Klein, 2016; Wong et  
430 al., 2016). Haptic experiences with paper are often described by children as authentic and  
431 real, and therefore preferred for learning, as compared to viewing digital books (Sax, 2016).  
432 The latter ultimately remains dependent on the technology used and its availability.

433

434 Studies show that comics are suitable for teaching natural sciences to children (e.g.,  
435 Farinella, 2018; Spiegel et al., 2013; and references therein). Even the often difficult-to-reach  
436 target group of young adults (often referred to as the ‘virtual’ generation in the age of  
437 smartphones and digital media) can be addressed by means of graphic novels (Yang, 2008).  
438 Young adults are stimulated in their imagination by the illustrations and receive the content  
439 through independent exploration (Tatalovic, 2009, Short et al, 2009). The general suitability  
440 for a diverse community of interest within a wide variety of backgrounds lies in the anchoring  
441 of comics in everyday life (Tatalovic, 2009). This broad audience wants to be met by  
442 adequate forms of communication and be encouraged to think about scientific content  
443 (Tatalovic, 2009).

444

445 Barrier-free access can be achieved by offering at least two sensory styles (‘two-senses  
446 principle’; Metzger, 2016): an illustrated book with a reduced amount of text (for example an  
447 exhibition catalog) can be picked up repeatedly and continues to function as a mediator  
448 while creating memories. The combination of images and reduced text also supports student  
449 learning (Wong et al., 2016). Science communication can use this ‘multimedia approach’ to  
450 communicate topics with a lasting effect, especially since much more information can be  
451 conveyed in a picture than in a length-limited text. Graphic novels can increase interest in a  
452 topic through this interplay of image and text (Wong et al., 2016).

453

454 However, illustrations can still leave room for misinterpretation (Wong et al., 2016) and are  
455 therefore often only a complementary element to the communication of knowledge. This  
456 element, created through the collaboration of artists and scientists, gains credibility and  
457 authenticity in interaction with original objects, dioramas, and reconstructions (Klein, 2004;  
458 Berta, 2021). Whereas dioramas or individual drawings tend to ‘freeze’ a particular moment  
459 in time (Abel and Klein, 2016), a continuing story in a graphic novel allows for a change in

460 perspective and better represents the multi-faceted nature of extinct organisms and  
461 ecosystems.

462

## 463 2 The EUROPASAURUS graphic novel: defining a new niche 464 of scientific credibility in graphic novels

### 465 2.1 Motivation

466 As laid out in section 1.4, graphic novels possess several benefits for science  
467 communication. In other natural sciences, the use of such educational graphic novels is  
468 more widespread. Environmental sciences, for example, lead the way. They do not only  
469 cover the climate crisis (e.g., Squarzoni and Whittington-Evans, 2014) but also general  
470 environmental work (e.g., Bertagna and Goldsmith, 2014), waste problems such as the  
471 Great Pacific Garbage Patch (Allison, 2012; Harris and Morazzo, 2013), severe changes in  
472 the biosphere (Kurlansky and Stockton, 2014), or suggestions of personal changes to  
473 reduce the carbon footprint (Dávila, 2011).

474 While guide books for the creation of graphic novels in general do exist (e.g., McCloud,  
475 1993; McCloud, 2006), together with countless online blog posts and videos, we did not use  
476 any of them actively in the creation of our book. Strangely, however, special literature  
477 regarding the creation of educational graphic novels does not seem to exist. To remedy this  
478 situation, we would like to share what we learned in creating our graphic novel and from a  
479 survey among the readers of this book.

480 The origin of our graphic novel lies in the active science communication that was carried out  
481 continuously during a paleontological research project about the dinosaur *Europasaurus*  
482 (see section 2.2). This science communication involved not only regular press releases  
483 about new discoveries and technical articles, but also talks as well as guided tours at the  
484 actual excavation site. The idea for a popular science book, or more precisely, for a graphic  
485 novel was born after several years of exchange with the interested public. Our plan was to  
486 create a colorful work that would be both exciting and scientifically plausible. Hence, this  
487 approach falls into the “Genre potpourri” in dinosaur comics from section 1.3. Most similar is  
488 the approach in *Mimo on the dinosaur trail* (Mazan et al., 2016), which has a similar purpose  
489 and presents the excavation results from Angeac-Charente in western France (Allain et al.,  
490 2022) with its diverse flora and fauna in an age-appropriate way. There are significant  
491 differences in content and style, but the overall aim of immersive presentation of excavation  
492 results is remarkably identical. At the time of the EUROPASAURUS graphic novel's idea

493 development, however, *Mimo* was not known and thus served neither as a template nor  
494 inspiration. It shows, however, that different people can independently develop similar ideas  
495 for transferring knowledge.

496 Out of the practically endless ways to tell a story in a graphic novel (for some suggestions  
497 see section 1.3) we decided on several basic parameters: 1) a documentary approach  
498 without anthropomorphized main characters, 2) a calm narrative style, and 3) the integration  
499 of scientific facts and references to actual fossil finds. Because only dinosaur books up to  
500 elementary school age were available on the German book market, our goal was to reach an  
501 older audience while also attempting to close the gap towards the specialized literature.  
502 However, the target group of our book was basically all people interested in the geological  
503 past, visual media, and/or illustrated works. Special focus was given to children from about  
504 ten years, teenagers, and young adults, who often seem to have outgrown their 'dinosaur  
505 enthusiasm' from early childhood. These young readers are able to experience the life of  
506 dinosaurs visually and enjoy easily accessible media content such as graphic novels and  
507 digital motion comics. Readers are required to have little or no prior knowledge of the  
508 subject. The content is easily understood through the narrative in pictures and aims to spark  
509 interest in more information. Even without reading the text, the book's design allows  
510 following the story. The focus of a graphic novel is of course on the graphic narrative part,  
511 but at the same time, background information in the appended factual section includes state  
512 of the art research results in easy language. From the beginning, the book was planned to  
513 be bilingual German/English in order to expand the readership beyond a German-speaking  
514 audience. With these ideas in mind, we developed several research questions and  
515 addressed them in an online survey (see section 2.3).

516

## 517 2.2 Scientific background

518 The *Europasaurus* Project researches one of the most important Mesozoic sites for fossil  
519 vertebrates in Europe—the Langenberg Quarry at the northern rim of the Harz Mountains  
520 near Goslar in Lower Saxony, Germany. The peculiarity of this site is the inclusion of fossils  
521 of terrestrial vertebrates such as lizards (Richter et al., 2013), crocodylomorphs (Schwarz et  
522 al., 2017), pterosaurs (Fastnacht, 2005), the dwarf sauropod dinosaur *Europasaurus holgeri*  
523 Sander et al., 2006 (Carballido and Sander, 2014; Marpmann et al., 2015; Carballido et al.  
524 2020), and theropod dinosaurs (Lallensack et al., 2015; Gerke and Wings, 2016; Evers and  
525 Wings, 2020), which are limited to a few layers next to commonly occurring marine fossils  
526 (Wings and Sander, 2012). The vertebrate remains were transported into the shallow marine  
527 depositional environment during the Kimmeridgian (Late Jurassic, about 154 million years

528 ago; Zuo et al., 2018). At that time, Europe was still a tropical archipelago. The terrestrial  
529 fossils came from a nearby island and, in addition to land plants, include predominantly the  
530 remains of dinosaurs but also many other vertebrate groups. Bones and teeth of the small  
531 sauropod dinosaur *Europasaurus* are particularly common. With a maximum height of three  
532 meters and a length of eight meters, this macronarian sauropod was much smaller than its  
533 closest relatives, who rank among the largest land animals of all time. Food sources of  
534 *Europasaurus* were probably limited on the island, which may have led to island dwarfism  
535 over time—a recurring pattern throughout evolution (Sander et al., 2006). The discovery of  
536 the first Jurassic mammals in Germany (Martin et al., 2016, 2019, 2021a, 2021b) and a  
537 number of other new taxa added to the success story of this research project. Due to the  
538 large number of unusual and well-preserved fossil finds, which due to their often fragmentary  
539 nature reveal little to non-specialists, a visual reconstruction of the living world of that time  
540 was tantalizing. A grant for innovative high-profile scientific outreach allowed the realization  
541 of a special project: the graphic novel *EUROPASAURUS - Life on Jurassic Islands* (Wings  
542 and Knüppe, 2020), presenting the results of many years of research on fossil organisms  
543 from Langenberg and their Late Jurassic ecosystem in an easily accessible form.

544

## 545 2.3 Methods & Ethics

546 Because several of our ideas and reasoning in creating this graphic novel were rather  
547 guesswork than solid facts, we decided to ask our audience some questions via an online  
548 survey.

549 The background to the survey was centered around the following questions:

- 550 1. Are graphic novels as analogue media generally of interest and is this interest age-  
551 dependent?
- 552 2. In the opinion of the interviewees, are graphic novels suitable for conveying (natural)  
553 scientific content?
- 554 3. In the opinion of the interviewees, are bilingual graphic novels also suitable for teaching a  
555 foreign language?

556 Almost two years after the publication date of the book, we started to address these  
557 questions in an online questionnaire. Fortunately, it was possible via Social Media to reach  
558 out to a large number of readers and an online survey was designed using Google Forms.  
559 The aim of the anonymous online survey was to record the general impressions of the  
560 graphic novel in terms of its design and structure on the recipients. Furthermore, the

561 suitability of the book for conveying scientific content and foreign language skills was  
562 evaluated. The survey was carried out as a questionnaire with mostly 5-point Likert scales.  
563 The collected data was processed using Microsoft Excel and evaluated with the statistical  
564 software pspp with regard to Pearson correlation ( $r$ ) of the scales and significance ( $p$ ), with  
565  $0.5 < |r| \leq 0.8$  for a clear linear connection and  $0.8 < |r| \leq 1.0$  for high to perfect linear  
566 connection of the scales. A  $p$ -value  $< 0.05$  is considered significant. In addition, the  
567 participants had the opportunity to verbally formulate comments regarding three other  
568 aspects. The answers to these open questions were addressed in a thematic analysis.  
569 Furthermore, we started a preliminary thematic analysis of the reviews of the book on the  
570 Amazon website.  
571 All information was treated as strictly confidential in accordance with the EU General Data  
572 Protection Regulation (GDPR) and according to the guidelines of the Department of  
573 Didactics of Biology at the Martin Luther University of Halle-Wittenberg. All research results  
574 and survey information were only used in an anonymous form, the identification of individual  
575 participants in the questionnaire is impossible.

576

## 577 2.4 Survey results

578 A total of 152 persons participated in the survey. This number is well above the  
579 recommended minimum number of 120 samples for statistical analyses and thus allows 90%  
580 confidence intervals for the endpoints of the normal range (Reed et al., 1971). The majority  
581 (69.7%) of the participants were male. Of all participants in the survey, more than half  
582 (52.3%) consider themselves to have very good knowledge of paleontological topics,  
583 another quarter of the participants (25.2%) estimated their paleontological knowledge still as  
584 good.

585 Surprisingly, the age structure of the participants was quite mixed (Fig. 9a), with the group of  
586 16-25-year-old making up over a third (37.5%) and those over 25 making up just over half  
587 (54.6%). Most readers picked up the book several times (Fig. 9b). The frequency of  
588 engagement with the book was not dependent on age ( $p=0.577$ ). The basic interest in  
589 graphic novels or comics (Fig. 9c) is also not significantly ( $p= 0.325$ ) age-dependent among  
590 the test persons. Within this sample, overall rating ( $r=0.037$ ;  $p=0.652$ ), extent of prior  
591 knowledge ( $r=-0.105$ ;  $p=0.202$ ), and interest ( $r=-0.125$ ;  $p=0.126$ ) were found to be equally  
592 independent of age.

593 The estimated increase in knowledge through the graphic novel (Fig. 9d) of the remaining  
594 22.5% of the respondents with no or little prior knowledge, however, differed only marginally  
595 from that of the entire sample (3.45 vs. 3.46 in the mean), so that an increase in knowledge

596 can be assumed for all respondents to about the same extent, which then, however,  
597 probably refers to different, previously unknown areas. Overall, 16.4% of the respondents  
598 found the graphic novel interesting and 80.9% even very interesting. An almost identical  
599 picture emerged from the evaluation of the book in the form of awarding stars (\* - worst  
600 evaluation, \*\*\*\*\* - best evaluation), with 82.5% awarding five stars and 15.8% awarding four  
601 stars.

602 Regarding the suitability of graphic novels for science communication, over 96% of the  
603 participants found it to be a useful (15.8%) or very useful (80.9%) tool for knowledge transfer  
604 (Fig. 9e). This underlines the applicability of graphic novels for knowledge transfer, as  
605 significantly fewer participants indicated a great (28.3%) or very great (28.9%) interest in  
606 these media when asked for their general interest in graphic novels or comics (Fig. 9c). An  
607 extremely high significance was shown with the participants, who indicated a basically large  
608 interest in comics and graphic novels, these evaluated this book as very interesting  
609 ( $p=0.000$ ). The extent of the factual part was considered to be enjoyable by most readers  
610 (Fig. 9f).

611 A comprehensible preference of the native language, both in the graphic and in the factual  
612 part of the book, could be recognized. However, about a third of the participants (29.6%)  
613 read also all texts of the graphic part in the other language, with the factual part, it was still  
614 about a quarter of all participants (23.7%). The bilingualism of the book as a whole was  
615 evaluated by the predominant number of the survey participants as a good (20.4%) or very  
616 good idea (64.5%) (Fig. 9g). Furthermore, about two thirds see the bilingualism as rather  
617 positive for the learning of a foreign language (36.2% beneficial and 32.9% very beneficial)  
618 (Fig. 9h). There was a strong correlation between engagement with graphic and factual  
619 sections in the foreign language ( $r=0.89$ ).

620 With regard to the assessment of the appropriateness of the pricing, at least the test persons  
621 who gave high ratings felt that the book was appropriately priced ( $p=0.000$ ) and would buy it  
622 again or recommend it to others ( $p=0.000$ ). The situation was different when respondents  
623 were asked if they would look at the book with children. Even though 52.6% of the  
624 respondents would definitely look at the book with children and 30.3% stated that this was  
625 still likely, there was no dependence on the general evaluation ( $p=0.716$ ,  $r=0.030$ ).

626 In addition to the survey, the participants had the opportunity to verbally comment on three  
627 different aspects of their engagement with the graphic novel. The first question related to  
628 scenes or sections in the book that were particularly memorable. 108 participants  
629 commented on this. From the responses, the following categories of design or plot were  
630 highlighted based on the frequency of mentions (more than 10 mentions). Frequent positive  
631 statements about the design referred to the realism or detail of the drawings (22 mentions;  
632 20.4%), while 21 mentions (19.4%) emphasized the artistic design in the form of different

633 perspectives and views. The depiction of the biodiversity of living creatures was also felt to  
634 be particularly impressive (16 mentions; 14.8%). In addition, many different individual  
635 depictions were mentioned, the most common of which was the depiction of the  
636 thunderstorm (pages 72-75, 20 mentions; 18.5%).

637 The second question was aimed directly at what single aspect the participants liked best.  
638 Among the 120 responses, more than ten mentions each fell into four main categories: The  
639 quality of artistic representations was mentioned by 59 (49.2%) participants, 22 (18.3%)  
640 participants particularly highlighted the representation of biodiversity, 21 (17.5%) participants  
641 liked the factual part the most, and 12 (10%) people preferred the story.

642 97 participants also answered the last question, which asked for suggestions for  
643 improvement. In this regard, 42 people (43.3%) stated that they could not make any  
644 suggestions for further improvement in terms of complete satisfaction with the graphic novel.  
645 A more extensive factual section was recommended by 10 persons (10.3%), while two  
646 persons (2.1%) felt it was too long. Another five people (5.1%) suggested even more panels.

647 On the Amazon webpage, the EUROPASAURUS graphic novel has as of now (November  
648 11<sup>th</sup>, 2022) 44 ratings with an average score of 4.6 out of 5 stars. Fourteen customers left  
649 written reviews, of which nine originated in Germany, two are from Great Britain, two from  
650 the USA and one from Japan. Among the twelve non-professional reviews, four positively  
651 emphasized the bilingualism, eight praised the content approach (scientific background,  
652 story, topic), and four commented positively on the factual part (stirring interest, appreciation  
653 of the scientific elaboration). Two reviewers appreciated the scientifically correct  
654 representation of the actual processes, especially the (bloody) acquisition of food by  
655 predators via hunting prey whereas also two people doubted the correct representations  
656 (e.g.: of the animals). Regarding the possible target group, four suggest everyone who likes  
657 dinosaurs (including adults) while also four reviewers see it as suitable preferably for  
658 children at least six/seven years old. One person was inspired to look into the fossil site and  
659 planned to visit it. Two reviews recommended the book to others or did buy it again.

660

## 661 2.5 Discussion of survey results

662 Based on the results of this survey, the research questions formulated at the outset can be  
663 answered as follows: graphic novels, and this book in particular, meet with a very high level  
664 of interest due to both the quality of the design and the structuring of the content, and this is  
665 independent of both the age and prior knowledge of the readers. In the opinion of the  
666 interviewees, graphic novels are quite suitable for conveying scientific content and, at least

667 in this case, lead to a clear increase in knowledge among both pre-educated persons and  
668 laypersons. Moreover, bilingualism is seen as a good means of teaching a foreign language.  
669 However, it should be noted that the selection of test persons does not represent a random  
670 cross-section of recipients, but that the participants decided to participate voluntarily and  
671 thus possibly have a generally higher interest in graphic novels and/or paleontology.  
672

## 673 2.6 Storytelling with facts and fiction: The balance between 674 entertainment and scientific accuracy

675 For an especially vivid impression of this Jurassic ecosystem, the situations and behaviors  
676 shown in the images were chosen to be as diverse and visually creative as possible. In  
677 addition to fossil finds, analogies and comparisons with living animals and comparable  
678 habitats, as well as examples from the history of art and paleoart, served as inspiration. For  
679 example, the painting *Der Abend* by Caspar David Friedrich served as an initial inspiration  
680 for the composition of a forest scene at dawn, while the colors in this picture were mostly  
681 inspired by classic landscape paintings of Edwin Church (Fig. 10). A storm scene (Fig. 11) is  
682 a loose homage to the sea paintings by William Turner and Winslow Homer, while clouds on  
683 the following page can partially be traced back to influences by Albert Bierstadt (Fig. 12).  
684 Overall, the work of the Hudson River School, a group of landscape painters that included  
685 Church and Bierstadt (Avery et al., 1987), left an impression on many pages of the graphic  
686 novel. On the paleoart side, the work of Douglas Henderson was an important inspiration,  
687 especially his handling of light and shadows, structure of the images but also, for example,  
688 his use of dead wood. Additionally, major paleoart influences came from John Gurche's,  
689 John Conway's, Mark Hallett's, and Todd Marshall's works.

690  
691 We hoped that the graphic novel (although inevitably rendered outdated sooner or later by  
692 scientific advances) would provide a visually and intellectually appealing medium that will  
693 continue to excite future generations about the fossil flora and fauna of the Langenberg  
694 Quarry and paleontology in general.

695 The plot of the story revolves around the experiences of a juvenile individual of  
696 *Europasaurus*. Interwoven with subplots of various protagonists such as a series of  
697 predatory dinosaurs, marine crocodiles, turtles, pterosaurs, small mammals, lizards, and  
698 dwarf land-dwelling crocodyliforms, the story thus provides an overview of the entire  
699 ecosystem. Major events such as a storm, a lightning strike, and a fire serve as overarching  
700 plot highlights.

701 Due to the demand for scientific accuracy in the presentation (in contrast to a classic comic  
702 book), only limited means were available to create an emotional connection between the  
703 story's main character and the reader. Neither dialogue can be conveyed with typical comic  
704 speech bubbles, nor should emotions in the animals be portrayed in a pronounced way.  
705 Therefore, to bind the reader to the main character and create empathy, 'fictional' elements  
706 of the so-called 'hero's journey' were used. At the beginning, the hero, a young  
707 *Europasaurus*, lives comfortably under the care of the herd. A stroke of fate leaves the  
708 protagonist on its own. The young animal must outgrow itself and continue on its way alone.  
709 Although the course of this plot is fictional, it always remains realistic and plausible. For  
710 example, a lightning strike as depicted killing the herd in our book is considered the most  
711 plausible scientific explanation for the *Europasaurus* bone bed (Wings and Knüppe, 2020),  
712 which contains remains of at least 21 individuals representing all ontogenetic stages (Scheil  
713 and Sander 2017).

714

## 715 2.7 Storytelling with pictures: How to find a unique style

716 From the beginning, a hybrid between comic book style and non-fiction book detailed  
717 paleontological illustrations was planned. The square format of the book unfolds to double  
718 pages in wide format. Each double page was used in full size for a basic illustration showing  
719 a core message (Fig. 13A). In this basic illustration, small comic panels are placed that  
720 either advance the plot or provide further insights into the ecosystem. Occasional text blocks  
721 offer further information. We refrained from using a typical comic panel-to-panel structure on  
722 a white background and the distinctive hand-lettered black font set in white speech bubbles  
723 or boxes. Instead, all design elements were subordinated to the overall impression of the  
724 double pages and later adapted for a visually balanced outcome (Fig. 13B).

725 Our goal during the course of the story was to display the broadest possible spectrum of  
726 different color and light moods in order to present them in a visually interesting way,  
727 reaching a length of around 140 pages (around 70 double pages).

728 Time of day, weather, landscape, and flora as well as the change from wide settings (such  
729 as landscapes) to detailed representations of small animals were used to create constantly  
730 new image themes in accordance with the storyline. The dramatic composition and  
731 representation of the main elements of the story essentially controls how long the reader  
732 stays in such a world of pictures, colors, and moods.

733 This principle becomes evident on the first 18 double pages (Fig. 14): We started with a  
734 picture dominated by black, showing the earth from a distance during a sunrise (1). We

735 'open the curtain' and accompany a marine crocodyliform *Machimosaurus* on its journey  
736 from the ocean (2–3) through a river delta (4) into the hinterland of an island. There in a lake,  
737 the individual first fights (5–6) and then mates (7). On pages 2 and 3, deep blue tones depict  
738 the ocean, which then gradually merge into green colors, illustrating the inland areas. The  
739 mating takes place in the 'romantic' warm light of a sunset (7). The first seven double pages  
740 illustrate the behavior of the *Machimosaurus* over the course of a day. During the night, the  
741 small multituberculate mammal *Teutonodon* meets a sleeping (dying) *Machimosaurus* (8).  
742 Now the focus switches to *Teutonodon*, and we accompany it on its prow through the night  
743 (9–11) until the mammal reaches its den, where it takes care of its offspring and falls asleep  
744 among them (12–13). The nocturnal images are mostly implemented in close-up views with  
745 detailed depictions. In contrast, the following dawning new day is introduced in a large wide-  
746 angle landscape shot (14). The subsequent four double pages show the *Europasaurus* herd  
747 near the mammalian den. The story continues on a sunny day in a light forest dominated by  
748 green (plants) and yellow (ground) colors (15–18).

749 From the beginning, all images were planned and created to stand alone (i.e., without text) in  
750 order to use the visual medium to its maximum effect. In some places where short  
751 explanations could contribute to a better understanding of the storyline, reduced text was  
752 added to the sequence of images in a final production step. The factual section following the  
753 narrative graphic novel part explains the main scientific results of the *Europasaurus* Project  
754 in an easily understandable way. Its bilingualism (German/English) ensures easy access of  
755 an international audience to the background information.

756

## 757 2.8 How to maximize awareness: Social media and exhibitions

758 The book was published in November 2020. It contains 184 pages, 38 of which comprise the  
759 scientific background. At the same time the book was published, social media activities on  
760 various channels (Twitter, Instagram, Facebook, and YouTube) were started for promotion.  
761 We also provided free access to half of the book's content on YouTube as animated motion  
762 comic videos. In four episodes, short stories about different organisms in the ecosystem of  
763 the time are told: episode 1 deals with the marine crocodyliform *Machimosaurus*, episode 2  
764 with the small nocturnal mammal *Teutonodon*, episode 3 with *Europasaurus* and predatory  
765 ceratosaurs, and episode 4 focuses on a natural disaster that probably took place at that  
766 time and caused the mass occurrence of fossil bones. Each of the four videos is available in  
767 English and German versions. The free online access helps to achieve a large international  
768 distribution (link to the first English episode on YouTube: <https://youtu.be/ftkxBgQJslM>).

769 Beyond presentation in digital media, the detailed life restorations beg to be presented on a  
770 larger scale in the context of exhibitions. Some *Europasaurus* works were already on display  
771 in the special exhibition ‘KinoSaurier’ at the Lower Saxon State Museum Hannover,  
772 Germany, and the Natural History Museum in Vienna, Austria. Overall, the responses to the  
773 graphic novel have been very positive, and we hope that through our work we can also  
774 contribute to a better understanding of prehistoric times in Germany.

775

## 776 2.9 Insights into the production process

777 A small team of people, whose different professions complemented each other, created the  
778 graphic novel *EUROPASAURUS – Life on Jurassic Islands*. Vertebrate paleontologist Oliver  
779 Wings, an expert on the fossil biota of the Langenberg locality including *Europasaurus*,  
780 provided the scientific background. Paleoartist Joschua Knüppe illustrated press releases  
781 about the newly described taxa from the Langenberg Quarry for several years, providing him  
782 with a solid base of knowledge for this project. Knüppe created a total of 275 detailed  
783 illustrations for the comic section and a further 80 illustrations for the factual section of the  
784 book. Media designer and art director Henning Ahlers was responsible for the consistency of  
785 the narrated story, done through ‘visual storytelling’ with a continuous arc of suspense and a  
786 coherent color scheme. Museum educator Arila Perl took care of the design and typesetting  
787 of the entire book. The creation of the book took a total of three years from the conception of  
788 the first chapter to the final print. Up to two dozen versions of storyboards for the respective  
789 storyline were created in advance before the final version of the illustrations were  
790 implemented as elaborate acrylic paintings. Due to the spatial separation of the team, video  
791 conferences were the primary form of communication. Even before the pandemic, these  
792 online meetings took place several times a week.

793 After collecting ideas and determining a first rough plot, storyboard sketches were created  
794 (mostly on brown paper) in order to precisely indicate the arrangement of light and shadow  
795 (Fig. 15). These early storyboards served as the basis for further discussions to detail and  
796 refine the story. Especially in the later developmental stages, traditional sketches were  
797 combined with digital ones, allowing the team to witness and discuss their creation through  
798 screen sharing.

799 Once the compositions and story of a section were finalized, the sketches were transferred  
800 onto large paper. Each double page was painted in 58.5 x 29.5 cm format, larger than their  
801 final book printing in order to ensure a higher detail density. During the early creation of the  
802 chapters, the base coat of paint was applied with large brushes. However, this often led to

803 uneven color gradients and noticeable brushstrokes, especially with darker tones.  
804 Eventually, we switched to the use of small synthetic sponges for the application of the first  
805 layers of paint. On top of these, a rough sketch of the composition was drawn and the first  
806 shapes of flora and fauna blocked in, starting with the scenery and ending with the main  
807 focal points of the painting. Here, a mixture of gouache, acrylic paints, watercolors, and  
808 colored pencils was used. After shapes and shadows were depicted, details like skin  
809 patterns and textures were added. This later stage often went through a few discussions to  
810 ensure consistent quality and effectiveness of the compositions. After the drawing stage was  
811 complete, final digital high-resolution scans of the picture were produced accompanied by a  
812 first rough color correction, retouches, and sometimes further digital enhancement. The final  
813 step before publication consisted of detailed retouches (digitally removing dust particles,  
814 etc.) as well as color and brightness corrections. The front flyleaf (Fig. 16) as well as two of  
815 the double pages (Figs .17, 18) give examples of the final outcome.

816

### 817 3 Conclusion and Outlook

818 Since their scientific discovery almost 200 years ago, dinosaurs and other extinct taxa have  
819 always inspired our imagination, and they will likely continue to do so in coming generations.  
820 Their common appearance in pop culture provides an unparalleled opportunity for  
821 transmitting paleontological research to the public. Projects like the *EUROPASAURUS – Life*  
822 *on Jurassic Islands* graphic novel provide the means to correct common misconceptions of  
823 fossil organisms, their interactions, and former ecosystems in the public eye.  
824 Such publications also combine useful sources of information and fun in education. We hope  
825 that our experiences may inspire others to create similar works on other paleontological  
826 topics or even other disciplines of geoscience. This is further underlined by the past success  
827 of comics about past worlds and their inhabitants, whether as adventure, illustrated science  
828 book, or self-narrative documentary.

829

### 830 Data availability

831 Data were collected from the available comic and graphic novel literature. We acquired  
832 permissions for the depicted images from the current copyright holders to the best of our  
833 knowledge. Most works are still publicly accessible to purchase.

834

## 835 Author contributions

836 OW, JK, HA and JF conceptualized and designed the EUROPASAURUS graphic novel, AP  
837 carried out the typesetting of the book. OW and JF developed the idea for this article. JF  
838 provided the initial review of comics and graphic novels, JK the section on paleoart, AP the  
839 section about teaching science with graphic novels, OW, JK, HA wrote the section on the  
840 EUROPASAURUS graphic novel. JF, HA, JK, and OW prepared the figures for the article.  
841 OW, JF and SK designed the questionnaire which was evaluated by SK. OW and JF  
842 prepared the draft and edited several pre-publication manuscripts with contributions from all  
843 other authors.

844

## 845 Competing interests

846 The authors declare that they have no conflict of interest.

847

## 848 Acknowledgements

849 In preparing this article, considerable time was spent in obtaining the necessary permissions  
850 to reproduce copyrighted material in this open access article in order to allow the reader to  
851 experience the various comics with their merits and peculiarities. We sincerely hope that we  
852 have not overlooked any claims, and would like to thank the many people, artists, and  
853 publishers for further information and generous permissions to use their graphics in our  
854 article. We thank in alphabetical order: Anja Adam (Egmont Ehapa Media, Berlin), Verena  
855 Arzmilller (Carlsen Verlag, Munich), Matteo Bacchin (Milan), Mandy Barr (DC Comics, New  
856 York), Saskia Baumgart (Bulls Pressedienst, Frankfurt am Main), Bradford W. Berger (First  
857 Classics, Inc., Pioneertown), Meghan Chan and Kari Torson (Dark Horse Comics,  
858 Milwaukie), Ricardo Delgado (Los Angeles), Achim Dressler (Bocola Verlag, Klotten),  
859 Eckhard Friedrich (Bildschriftenverlag, Hannover), Tadd Galusha (Anchorage), Abby Howard  
860 (Charlotte), Irene Kahlau and Helga Uhlemann (Tessloff Verlag, Nürnberg), Mike Keesey  
861 (Los Angeles), Jim Lawson (Chesterfield), Robert Löffler (MOSAİK Steinchen für Steinchen  
862 Verlag, Berlin), Ted Rechlin (Rextooth Studios, Bozeman), Max Schlegel (Splitterverlag,  
863 Bielefeld), Mark Schultz (Clarks Summit), Stephanie Steinmetz [The Walt Disney Company  
864 (Germany), Munich], Stephen R. Bissette (Vermont), Rosemary Volpe and Erin Gredell  
865 (Peabody Museum of Natural History, Yale University), Rostislav Walica (Prague), Cathy

866 Wilbanks (Edgar Rice Burroughs, Inc., Los Angeles), and Nadine Winns (Abbeville Press,  
867 New York).  
868 Brian Andres (University College Birmingham) and Larry Rhinehart (Albuquerque) are  
869 acknowledged for corrections and comments on earlier versions of this manuscript. Andreas  
870 Stark (University Halle-Wittenberg) helped with the thematic analysis. We are grateful to the  
871 editor John K. Hillier as well as the reviewers Jeff Liston (Royal Tyrrell Museum of  
872 Palaeontology, Canada) and Victoria Coules (University of Bristol, UK) for their helpful  
873 comments that put the final touches on the manuscript. Moreover, we thank the Volkswagen  
874 Foundation for funding the *Europasaurus* Project and the creation of the graphic novel. The  
875 Dinosaurier-Park MÜNchehagen, Nils Knötschke as well as Fabian and Janna von Pupka  
876 supported and permitted our field work.

877

1424 Domain; (d) *Storm over the Jurassic Sea*, artwork by Joschua Knüppe (2019),  
1425 EUROPASAURUS graphic novel, page 74-75 (© Wings & Knüppe 2020).

1426

1427 **Figure 13:** (a) Example of a final double page in the book; (b) Schematic structure of this  
1428 double page: The structure of the basic illustration and the movement of the *Europasaurus*

1429 herd correspond to the usual “western” reading direction from left to right. The reader starts  
1430 in the familiar way of looking at the top left and following the diagonal direction of action  
1431 across the center of the picture to the bottom right (1). As graphical compensation, two inset  
1432 panels were placed at the bottom left, which in turn are set from left to right in their reading  
1433 direction (2). The left panel is placed behind the right panel, supporting the desired reading  
1434 order. The panels illustrate a detail as well as another perspective of the action in the basic  
1435 illustration. When designing double pages, it is always important to ensure that the area in  
1436 the middle of the picture does not contain crucial information, as this might otherwise be lost  
1437 during binding of the book (3). The text block in the upper right corner (4) provides additional  
1438 graphic balance. The necks of the sauropods point up to the text block. They represent the  
1439 last element in the sequence of perception on the double page. The text offers additional  
1440 information about the action of the herd action, namely their motivation. Horizontal lines,  
1441 resulting from the surf, the beach and the tree line, stabilize the overall presentation of the  
1442 double page with its otherwise diagonal impression (© Wings & Knüppe 2020).

1443

1444 **Figure 14:** The color scheme of the first 18 double pages of the book. Changing the dark  
1445 distance view at the beginning into deep blue, and later green colors. A warm sunset light  
1446 closes the first day, followed by dark night scenes. The second day starts again with warm  
1447 colors, whereas green and yellow dominates the landscapes on the following pages. For  
1448 more explanation, see main text (© Wings & Knüppe 2020).

1449

1450 **Figure 15:** The evolution of storyboard sketches sometimes included many different  
1451 versions for a particular scene. This double page combines the end of a turtle hatchling  
1452 storyline with the introduction of (swimming) torvosaurid theropods (© Wings & Knüppe  
1453 2020).

1454

1455 **Figure 16:** The front flyleaf of the book introduces all larger vertebrates in the same scale (©  
1456 Wings & Knüppe 2020).

1457

1458 **Figure 17:** This double page shows *Europasaurus* individuals during feeding on the shore.  
1459 One individual is feeding on kelp which offered the opportunity to show some of the shallow  
1460 marine organisms too (© Wings & Knüppe 2020).

1461

1462 **Figure 18:** This double page shows the juvenile *Europasaurus* moving through a horse tail  
1463 forest. Some eupterodactyloid pterosaurs are hitching a ride (© Wings & Knüppe 2020).
