27

28 Abstract:

29 The first part of this article gives an overview of influential comics and graphic novels on
30 paleontological themes from the last twelve decades. Through different forms of
31 representation and narration, both clichés and the latest findings from paleontological
32 research are presented in comics in an entertaining way for a broad audience. As a result,
33 comics are often chroniclers of 20th century scientific history and contemporary paleoart.
34 The second part of this article deals with the development of the bilingual graphic novel
35 *EUROPASAURUS - Life on Jurassic Islands*, which communicates knowledge from

36 universities as well as museums to the public. This non-verbal comic presents the results of
37 a paleontological research project on a Late Jurassic terrestrial biota from northern Germany
38 in both a scientifically accurate as well as an easily understandable way, based on the way
39 of life of various organisms and their habitats. Insights into the creative process, the
40 perception of the book by the public, and ideas on how to raise public awareness of such a
41 project are discussed.

42

43 1 Introduction

44 The communication of scientific research via contemporary and creative ways is becoming
45 more and more important for research institutions. Paleontological topics are often met with
46 special interest by the public, especially when it comes to vertebrate paleontology. From our
47 experience, maximum attention is paid to dinosaur research, which often reaches an
48 international distribution in the media, depending on the momentary situation on the global
49 news market. However, all press releases and subsequent press articles share one
50 disadvantage—their short-lived nature. After a maximum of several days, the reports are no
51 longer present in the media and will be quickly forgotten. Hence, this type of knowledge
52 transfer does not appear to be particularly sustainable.

53 Books on the other hand, are long-lasting and can accompany us our whole lifetime.

54 Unfortunately, text-heavy popular science books do not reach all groups in our society
55 equally (i.e., children from socially disadvantaged backgrounds) due to partially higher
56 barriers of accessibility. Easily accessible formats such as comics and graphic novels offer
57 opportunities to transmit science into possibly more neglected parts of our society.

58 This paper, consisting of two parts, addresses this issue with an example from the field of
59 paleontology. The first part provides an overview of the historical development of
60 paleontology-themed comics and graphic novels, the influence of paleoart in this genre, and
61 the potential of graphic novels in transmitting science into the public. The second part
62 focuses on the dinosaur-related graphic novel *EUROPASAURUS - Life on Jurassic Islands*
63 as an example. We explain our motivation for its creation, the production process, and our
64 strategy for advertising it, with the goal of encouraging other scientists to explain their
65 research results to the public in a similar fashion.

66

67 1.1 Paleontology within popular science books

68 Paleontological discoveries became known to a wider audience in the mid-19th century, due
69 to public lectures, the first ‘dinomania’ following the creation of the Crystal Palace life-sized
70 reconstructions of dinosaurs (Manucci and Romano, 2022), and the new spectacular
71 dinosaur finds from the United States. Since then, manifold books, articles, and even
72 collecting cards presenting the results and summaries of contemporary knowledge have
73 been published. In the beginning, these publications were primarily addressed to an adult
74 and educated readership (e.g., Flammarion, 1886; Knipe, 1905; Andrews, 1926; Bölsche,
75 1931; Knight, 1935; Augusta, 1942), but by the 1950’s younger readers were also reached
76 by a wide range of age-appropriate and lavishly illustrated books (e.g. Scheele, 1958;
77 Watson, 1960; D’Ami, 1973; Norman, 1985). Nowadays, such children books dominate the
78 market of non-professional paleontological publications, often resulting in a marginalization
79 of dinosaur topics as ‘kids’ stuff’ in the view of the general public (Liston, 2010). However,
80 there were always outstanding paleontological popular science books for adult and mixed
81 audiences as well (e.g., Augusta and Burian, 1956; Spinar, 1972; Stout, 1981; Cox et al.,
82 1988; Norman, 1988; Czerkas and Czerkas, 1990; Holtz, 2007). All these books share a
83 relatively text-intensive style, although many of them qualify as so-called ‘coffee table’ books
84 with a variety of large-sized colorful illustrations. Unfortunately, the information contained on
85 specific paleontological topics is often slightly outdated by the time of release. This is
86 especially true in children’s books, a market where it is often not seen as necessary by
87 publishers to be up-to-date. New ideas and paradigms in paleontological research take
88 years to reach a non-academic audience and even decades to determine the perception of
89 the general public on that topic (Ross et al., 2013). However, communication on the latest
90 paleontological knowledge can be realized most quickly and effectively by a medium
91 specifically aimed at a predominantly young audience (Liston, 2010)—the comic strip.
92

93 1.2 Influential paleoart

94 Paleoart is an art genre that depicts paleontological subjects realistically or artistically,
95 reconstructing extinct biota and their habitats based on scientific data. Artists who strive to
96 reconstruct prehistoric organisms and/or habitats as accurately as possible, often in close
97 collaboration with paleontologists and other specialists (Germann, 1943), are so-called
98 paleoartists (Hallett, 1987, Janzen, 2020). Although existing for about 200 years (Lescaze,
99 2017), paleoart still struggles for its reputation to be regarded as ‘real’ art compared to the
100 ‘classic’ genres (Janzen, 2020). In recent decades, there have been many approaches to

101 appreciating, classifying, and assessing paleoart and paleoartists (e.g., Czerkas and Olsen,
102 1987, Lescaze, 2017, Hübner, 2020, Janzen, 2020, Manucci and Romano, 2022), even
103 including instructions for making one's own attempts (Witton, 2018). Paleoart is a crucial link
104 between paleontology and public awareness because paleoartists illustrate paleontological
105 theories in their life restorations (Murray, 1997; Spindler, 2020).

106 Therefore, it is not surprising that contemporary paleoart has repeatedly served as a
107 template for the depiction of prehistoric life in comics since the early 20th century. Without
108 any paleontological research of their own, most comic authors and illustrators relied directly
109 on preexisting visual ideas of the subject. Although often exaggerated in their presentation,
110 the original artwork can often still be recognized in the animal contours, body postures, and
111 sometimes even color patterns (Fig. 1). Many panel drawings were almost exact copies of
112 their academic originals, which were recycled again and again. However, subsequent strips
113 also independently aligned themselves with the prevailing scientific view and reconstruction
114 (Murray, 1993, Liston, 2010). This transformation of contemporary paleoart and its
115 underlying paleontological ideas into panels makes comics chroniclers of advances in
116 paleontology. Many dinosaur comics thus accurately reflect contemporary paleoart and the
117 paleontological paradigms of the time. In particular, the paleoart of the so-called 'Classic Era'
118 from 1890 to the late 1960's (Witton, 2018) generated manifold inspiration and direct
119 templates for comics. During this period a triumvirate of paleoartists, the preeminent
120 authorities in the field, provided the 'graphical' fuel for memorable prehistoric worlds and
121 impressive archaic antagonists. Their paleoart was responsible for establishing the
122 standards of what dinosaurs should look like at the time, inspiring generations for how
123 dinosaurs were to be portrayed. They were so widespread and well-known in cultural
124 memory through books, comics and movies that even today many people are familiar with
125 their work (Gould, 1993; Czerkas, 2006; Ross et al., 2013, Janzen, 2020), even though they
126 may never have heard of their names.

127 The first of these most influential paleoartists was Charles Robert Knight (1874–1953).
128 Knight was a classically trained artist who specialized in animal paintings. He is probably
129 best known for his collaborative work on reconstructing extinct organisms with paleontologist
130 Henry Fairfield Osborn at the American Museum of Natural History in New York (Paul,
131 1996). He also reconstructed many fossil taxa described by the rival paleontologists Othniel
132 Charles Marsh and Edward Drinker Cope. Knight almost single-handedly established the
133 field of accurate artistic reconstruction of prehistoric life in public perception (Gould, 2001;
134 Bisette, 2003) and can be regarded as the first internationally renowned paleoartist (Witton,
135 2020). Part of his legacy is his rigorous approach to reconstructing extinct animals, providing

136 a guideline for subsequent generations (Knight, 1947). While his dinosaur reconstructions
137 are outdated today, many of his paintings and drawings of mammals still hold up to modern
138 standards. In two of the most famous and widely used templates of paleontological
139 reconstructions, Knight established *Brontosaurus* as a semiaquatic behemoth and
140 *Tyrannosaurus* and *Triceratops* as eternal enemies (Knight, 1935). In addition, his
141 surprisingly dynamic ‘Leaping Laelaps’ as well as numerous other murals and paintings
142 reproduced in books, periodicals, and journals (e.g. Knight, 1935, 1942, 1946; Czerkas and
143 Glut, 1982; Czerkas, 2006; Milner, 2012) provided a vast number of templates for prehistoric
144 lifeforms in comics. For example, the lost worlds with wonders and threats of the early
145 *Tarzan* and *Turok* series are unmissable testimonials to his work (Fig. 1a).

146 The second member of the triumvirate was Rudolph Zallinger (1919–1995). His contribution
147 to paleoart still echoes through paleontological history. While in his last year at the Yale
148 School of Fine Arts in 1942, he was offered to add “some kind of decoration” to a large wall
149 of the dinosaur hall at the Yale Peabody Museum. After pencil sketches and a preliminary
150 small-scale painting, or model, in egg tempera, Zallinger worked for three and a half years
151 on the 33.5 meter long mural *The Age of Reptiles*, a grand narrative of life from the
152 Devonian to the end of the Cretaceous. The mural was finished in 1947 (Volpe, 2007) but
153 did not become famous until a few years later, when Life magazine reprinted the
154 reproduction model as a foldable panorama (Life, 1953). With that, Zallinger’s fresco-like
155 depictions of prehistoric life became the gold standard for portraying dinosaurs for years to
156 come. In 1949, Zallinger received the Pulitzer Prize for his mural. He later created more
157 paleoart for other publications (e.g., Watson, 1960; Zallinger, 1966), but his most influential
158 work remains *The Age of Reptiles*. In particular, Zallinger’s iconic *Tyrannosaurus* was
159 frequently used in comic strips and serials until the 1960’s (Fig. 1b). Entire stories, especially
160 in *Turok*, were graphically based on this single image of a dinosaur in side view.

161 The third cornerstone for the inspiration (and plagiarism, Sadecký, 1982b) of prehistoric
162 wildlife in countless comics was the Czech artist Zdeněk Burian (1905–1981), who may be
163 the most influential paleoartist of the mid and late 20th century (Reich et al., 2021). His work
164 shaped public perceptions of prehistoric life like no other (except Knight, depending on the
165 European or American perspective). Burian achieved this by his immense productivity (with
166 some 1,300 images and preliminary sketches on prehistoric subjects; Rostislav Walica, pers.
167 comm.) and through his appealing, highly detailed images. He began his career as an
168 illustrator of adventure and science fiction novels (Sadecký, 1982a; Prokop, 2005). As such,
169 he was not only a master of various media, but also a skilled visual storyteller. Through his
170 work on novels about mammoth hunters (Štorch, 1937), he came into contact with the

171 paleontologist Josef Augusta and later with other scientists (Walica, 2003; Prokop, 2005).
172 These fruitful collaborations resulted in several lavishly illustrated large-format books on
173 evolution and the history of man (e.g., Augusta, 1942; Augusta and Burian, 1956, Spinar,
174 1972; Wolf, 1977). Despite the Iron Curtain, his works have been translated and exported
175 worldwide since the 1950's. Producing countless paleoart originals over several decades
176 (Müller and Walica, 2022), Burian can be considered the legitimate successor of Knight
177 (Witton, 2020). In comics, his first worldwide book success (*Prehistoric Animals* from 1956)
178 can be traced precisely to *Turok* #11 in 1958, where copies of his depictions of prehistoric
179 life started to complement and increasingly replace Knight and Zallinger's templates (Fig.
180 1c).

181
182

183 1.3 Comics and graphic novels about prehistoric life

184 Comics are a medium that expresses ideas with images. They often consist of sequences of
185 panels of images and are frequently combined with text or other visual information. Graphic
186 novels are books made up of comic content. They tell a longer and sometimes more
187 complex story and are distinct from 'comic books' that consist of comics, periodicals, and
188 trade paperbacks. Moreover, they represent a successful marketing concept for a form of
189 publication in which comics gain literary merit through book covers in order to be distributed
190 by major publishers in bookstores (Abel and Klein, 2016). A discussion of prehistoric topics
191 in cartoons is beyond the scope of this paper, although this theme and its sometimes even
192 bidirectional influence on paleontology (e.g., Gary Larson's "thagomizer"; Holtz, 2007) would
193 merit a review on its own.

194 Like most other comics, strips involving prehistoric creatures are aimed predominately at a
195 young target audience. The majority of previous and modern comics dealing with dinosaurs
196 and other prehistoric life serve as pure entertainment. They represent the absolute majority
197 of dinosaur comics with thousands of stories handling tales from science fiction, fantasy,
198 horror, mystery, western, or the superhero genre (Glut, 1980). Only a small but diverse niche
199 uses a different approach; not only providing enjoyable and thrilling stories, but also
200 contributing to the transfer of scientific knowledge and deepening the paleontological
201 background beyond the entertainment factor. This type of subtle education of the audience
202 may be achieved via individual panels with embedded information, via detailed elaborated
203 scientific content in a comic book style, or via a format in between.

204

205 Dinosaurs and their kin have always been a popular subject in comic strips. Starting as a
206 recurring inventory of excitement or terror in Sunday newspaper edition stories, extinct
207 animals later also got leading roles (sometimes as anthropomorphized characters) and even
208 sequel stories (Glut, 1980; Murray, 1993; Bissette, 2003). They were used in several
209 contexts, from entertainment to education, with a variety of formats between. The strips
210 grouped thematically below are a limited selection without any claim to completeness.

211

212 Adventure stories

213 The first and foremost use of prehistoric life in comics was—and still is—for the purpose of
214 pure entertainment without any interest in paleontological education. Prehistoric animals are
215 shown just as forces of nature. They are necessary to advance the story as villains (or
216 heroes) or a MacGuffin (an object that is necessary to the plot, but insignificant in itself), and
217 are merely used to create tension and action (Glut, 1980). The animals are usually depicted
218 as dangerous, vicious, stupid, carnivorous, and often pose supernaturally large threats for
219 the human protagonists. Commonly, the prehistoric lifeforms do not survive the encounter
220 with humans. These strips are essentially not dinosaur comics but comics with dinosaurs
221 (Bissette, 2003). Three recurring specific settings are widely used (Galle, 1993) to explain
222 the presence of the prehistoric creatures: 1) lost-world areas, a realm where they survived
223 until today; 2) other planets, strange worlds with primordial plants and animals; and 3) time
224 travel, the journey into their time or their retrieval into modern times.

225 The earliest comic reference to dinosaurs is *Prehistoric Peeps* from 1893 (Merkl, 2015), in
226 which prehistoric humans and dinosaurs satirically reflected and caricatured the present in
227 anachronistic situations. A subsequent example of more prehistoric encounters is the classic
228 Saturday newspaper comic strip *Dream of a Rarebit Fiend* by Windsor McCay, where
229 dinosaurs repeatedly appeared between 1905 and 1913, and were remarkably accurately
230 drawn by the standards of the time (Merkl, 2015). One of these comic pages (Fig. 2a)
231 already foreshadowed a topic McCay later reworked in his well-known animated dinosaur
232 film *Gertie the Dinosaur* in 1914 (Nathan and Crafton, 2013). Another classic newspaper
233 strip, *Madge, the Magician's Daughter*, also used a diverse dinosaur menagerie already by
234 1907 (Fig. 2b) to show a museum trip from a surprising new side (Wilson, 2010). A more
235 serious encounter was depicted in a multiple part Sunday edition of Edgar Rice Burrough's
236 *Tarzan* by Harold Foster from 1932, where the protagonist met a carnivorous (!) sauropod,
237 countless pterosaurs, and finally survived the attack of a giant and impressively colorful
238 *Tyrannosaurus rex* (Fig. 2c; Carlin and Foster, 2013). It took another five years before the
239 next comic dinosaur appeared. In 1937, *Prince Valiant* faced a sauropod-like swamp-
240 monster, which he defeated in the end. Tarzan's second encounter with a *T. rex* happened

241 in 1945 in Burne Hogarth's strip, where Tarzan managed to impale the obtrusive carnivore
242 (Hogarth, 2016). With #4 of the *Tarzan Comic* in 1948, dinosaurs finally became a regular
243 part of recurring Lost World stories for about 20 years, shaping many subsequent strips in
244 their representational form and color scheme (Fig. 2d; DuBois and Thompson, 2017). Other
245 comic serials started to use the potential of prehistoric threats and primordial adventures too,
246 and prehistoric topics have flourished in countless issues ever since (Murray, 1993; Glut and
247 Brett-Surman, 1997; Bissette, 2003). To date, nearly every superhero (team) in any
248 franchise has had its own encounter with members of the Dinosauria or other prehistoric
249 lifeforms (Glut, 1980). Starting in 1960 in *Star-Spangled War Stories* #90 by DC, US soldiers
250 were repeatedly confronted with over-sized Mesozoic creatures on countless Pacific islands
251 during World War II (Fig. 3a). It was not until 1968 that this *War That Time Forgot* ended
252 after 45 explosive clashes in #137. In the German *Piccolo* comics from the 1950's such as
253 *Akim, Sohn des Dschungels* [*Akim, Son of the Jungle*], *Sigurd, der ritterliche Held* [*Sigurd,*
254 *the Knightly Hero*] or *Raka, der Held des Jahres 2000* [*Raka, Hero of the Year 2000*], the
255 protagonists experienced adventures with most stereotypical dinosaurs on a regular basis
256 (ComicSelection, 2019). Even in the cataclysmic future world of *Xenozoic Tales* from 1987,
257 also reprinted under the title *Cadillacs and Dinosaurs*, a variety of marvellous illustrated
258 prehistoric animals, especially dinosaurs, complicated the postapocalyptic life of the two
259 main characters for 14 issues (Fig. 3b; Schultz, 2013).
260 However, there are also peaceful encounters with the prehistoric menagerie in thematically
261 quieter and more child-friendly comic series. In 1957, Donald Duck and his nephews
262 unintentionally experienced a 'Forbidden Valley' lost world adventure in *Walt Disney's*
263 *Donald Duck* #54 (Fig. 3c). In 1974, German *Fix und Fax* (#193–199) also visited a colorful
264 prehistoric setting (inspired by drawings from Bölsche, 1931) without causing collateral
265 damage among the inhabitants (Fig. 3d; Kieser, 2018). A similar story was told in a short
266 episode for the protagonist trio Abrafaxe in *Mosaik* #216–217, where they accidentally time
267 travelled to the Cretaceous (Fig. 4a; Schleiter, 2011). In series such as *The Adventures of*
268 *Tintin* (Hergé, 1947) and even *Asterix* (Fig. 4b; Ferri and Conrad, 2021), dinosaurs appeared
269 as MacGuffins instead of antagonists. In *Calvin and Hobbes*, prehistoric worlds are regular
270 retreats of fantasy from the dreariness of everyday life (Watterson, 2012).

271

272 Adventure stories supported by educational information

273 Besides pure adventure stories with prehistoric inventories, more educational approaches
274 have been realized too. The Dell serial *Turok, Son of Stone* also chose a lost world setting.
275 Starting in 1954, it became the longest running dinosaur serial with altogether 131 issues
276 until 1982. Two Native Americans, Turok and his young companion Andar, discover a lost
277 valley full of largely-varied, preferably dangerous ancient lifeforms. While all stories dealt

278 with their unsuccessful attempts to leave this inhospitable place, they met (and killed)
279 countless prehistoric creatures (Fig. 5a). In contrast to *Tarzan*, where the dinosaurs were
280 only a means for entertainment, the *Turok* authors provided additional information about
281 prehistoric life to the reader. Supplementary pages were included in every issue, detached
282 from the *Turok* universe. As of 1956, text pages about specific animals with illustrations as
283 headers were included—strongly reminiscent of chocolate trading cards from the first half of
284 the 20th century (Bölsche, 1916). By 1957, the additional separate short strip *Young Earth*
285 was established to alternate with the main story in every issue (Fig. 5b), focusing solely on
286 the prehistoric animals and explaining aspects like animal behavior or evolutionary patterns.
287 While most of these stories mixed Paleozoic and Mesozoic taxa indiscriminately, they can be
288 seen as the vanguard of the true dinosaur comics of the future. Similar approaches of
289 additional brief scientific background information were used in the Dell Movie Classics, such
290 as #845 (*The Land Unknown* 1957), #1120 (*Dinosaurus!* 1960), and #1145 (*The Lost World*
291 1960), to supplement the stories in the related films. Another example is the space storyline
292 of the German Digidags in *Mosaik* between 1961 and 1962 (Hegen, 2004, 2006). For ten
293 issues, starting with #51, the protagonists investigated several planets with different stages
294 of earth's evolution (even in the correct evolutionary order) (Fig. 5c), while the back cover in
295 each issue summarized scientific facts. The same approach, although from another
296 perspective, was used recently in *Paleocene* by Mike Keesey. Here, we see the world
297 through the eyes of anthropomorphized lemur-like primates just a decade after the asteroid
298 event that killed the dinosaurs, leaving behind a devastated world at the dawn of a new era.
299 While the primates try to survive against avian dinosaurs, the non-avian dinosaurs still exist
300 as dragons in fairy tales of the elders (Fig. 5d). Concise scientific facts introduce every issue
301 and provide framework and context for the events.

302

303 Adventure stories supported by sophisticated educational information

304 In tradition and as an extension of the *Young Earth's* narrative style, longer stories were
305 produced with a scientifically more robust background and naturalistic depictions of the
306 animals and environments. The focus in these modern comics was on the needs,
307 experiences, but also failures of the dinosaur protagonists. *Paleo* is an anthology of a dozen
308 different dinosaur stories from the Late Cretaceous in detailed monochrome panels,
309 highlighting also other animals such as marine reptiles and pterosaurs (Fig. 6a; Lawson,
310 2016). In contrast, *Tyrannosaurus rex* focused on a feathered tyrannosaurid individual,
311 Cobald, and its daily struggle to survive and to find a mate in the latest Cretaceous (Fig. 6b;
312 Rechlin, 2016). Subsequent volumes have extended this concept to other dinosaurs, as well
313 as the evolution of sharks, whales, and Ice Age mammals (e.g., Rechlin, 2018, 2019).

314

315 Self-narrative storyboards

316 Another approach is text-reduced visual storytelling, similar to a sophisticated storyboard.
317 This comic format is used in *Age of Reptiles* by Dark Horse Comics (Delgado, 2011, 2015),
318 which depicts the fate of several dinosaurs in four stories: *Tribal Warfare* from 1993 featured
319 a conflict between a *Tyrannosaurus* family and a pack of *Deinonychus*, *The Hunt* from 1996
320 followed a vendetta involving an *Allosaurus* and a group of chameleon-like *Ceratosaurus*,
321 *The Journey* from 2009 showed the annual migration of various Cretaceous dinosaurs herds
322 to new feeding grounds, and *Ancient Egyptians* from 2015 depicted a brief period in the life
323 of a *Spinosaurus*. While the first two stories partially anthropomorphized their non-human
324 protagonists in their overly violent action and motivation, subsequent stories were told closer
325 to the tradition of animal documentaries, attempting to avoid uncharacteristic animal
326 behavior and interactions. The paleontological background is not explained further. Instead,
327 the reader is challenged to extract all information from the colorful dynamic drawings (Fig.
328 6c). A similar approach was used in *Cretaceous* (Galusha, 2019) which tells the story of a
329 *Tyrannosaurus* family struggling with a group of marauding *Albertosaurus* and obtrusive
330 dromaeosaurs of all sizes. The pace of the story is further driven by the creative and
331 dynamic use of panels (Fig. 6d). Another text-reduced *Tyrannosaurus* adventure is *Love:*
332 *The Dinosaur*, where the vicious lead character interacts with more comic relief dinosaurs to
333 finally witness the inevitable asteroid impact (Brremaud and Bertolucci, 2017).

334

335 Comic science books

336 Paleontological information has also been conveyed through a direct implementation of
337 popular science book content in comic style. For example, an adventurous story with
338 (intrusive) human protagonists can be abandoned in favor of imparting knowledge transfer
339 through panels with text boxes. Classics Illustrated used this concept twice to present a
340 volume on paleontological knowledge of its time: in Classics Illustrated issue #19 *The*
341 *Illustrated Story of Prehistoric Animals* from 1959, and in its successor, Classics Illustrated
342 Special #167A *Prehistoric World* from 1962 (Fig. 7a). Several chapters present the history of
343 paleontology, the evolution of life, and the history of humankind in comic book form. In the
344 comic adaptation of the 1978 French animated series *Once Upon a Time... Man*, the history
345 of the earth before the appearance of humans was summarized in panels on several pages
346 in the first volume (Gaudin et al., 2021), together with the series actors as well as the
347 characteristic time clock (Fig. 7b). More recently, a more reflective account was provided in
348 *Alpha ...Directions* by Jens Harder, detailing the evolution of life up to the appearance of
349 humans. *Alpha* used classic iconic depictions from books, articles, movies, TV shows, and
350 also other comics to summarize concepts and mechanisms for evolution as well as the

351 development of life according to current understanding in collages of science and pop
352 culture. Short accompanying sentences articulate the main idea or message of each collage.
353 (Fig. 7c; Harder 2010). Another ambitious science comic, *Evolution: The Story of Life on*
354 *Earth* (Hosler et al., 2011), provides insights into evolutionary processes on Earth, including
355 paleontological topics, through black and white panels. The content covers highly complex
356 processes in an understandable way through entertaining one-liners of extant and fossil
357 organisms, presented and explained by an alien scientist in his holographic museum. In
358 *Science Comics: Dinosaurs* (Reed and Flood, 2016), the narrative structure follows the
359 history of scientific discoveries. The scientists portrayed, and sometimes even the dinosaurs,
360 were given speech bubbles to convey relevant information. In the *Earth Before Us* trilogy by
361 Abby Howard (Howard, 2017, 2018, 2019), we follow a scientist and a young girl through the
362 geological eras. Readers get information about evolution, experience the variety and beauty
363 of these lost worlds, and learn about the pronunciation of Latin names (Fig. 7d). Even a
364 glossary is provided. While most information is conveyed by the protagonists in speech
365 bubbles, some pages depicting animals in a particular ecosystem resemble puzzle pictures.

366

367 Genre potpourri

368 The previously mentioned comic styles can also be mixed (i.e., a documentary-style
369 narrative storyline with supporting text boxes supplemented by textbook-style background
370 information). Marvel's *Dinosaurs, a Celebration*, a four-issue series on stand-alone dinosaur
371 comic narratives by various artists and authors was first published in 1992. Each issue
372 contains four short, visually varied stories about different taxa, accompanied by blocks of
373 descriptive text, as well as textbook-style pages on different paleobiological topics
374 alternating with the stories. *Stephen R. Bissette's Tyrant* from 1994 tells the story of a
375 breeding *Tyrannosaurus* and an egg-hunting *Chirostenotes* in four issues (Bissette, 1994),
376 with ultimate consequences for one of them (Fig. 8a). The monochrome story focuses on
377 these protagonists, but also highlights other creatures such as insects, spiders or turtles of
378 the Cretaceous ecosystem. Finally, an entire volume is devoted to the development of the
379 embryo in the egg, which is probably unique in its complexity in the comic field. Scientific
380 information about the animals and their behavior is provided in an appendix to each issue.
381 The book series *Dinosaurs* (Bacchin and Signore, 2008) devotes each of the six volumes to
382 a particular Mesozoic ecosystem centered on distinct dinosaurs: *Plateosaurus*,
383 *Archaeopteryx*, *Allosaurus*, *Scipionyx*, *Argentinosaurus*, and the inevitable *Tyrannosaurus*.
384 In each volume, about 40 pages of graphic novel (Fig. 8b) are followed by 20 pages of
385 extensive textbook with detailed background information on the depicted taxa, their
386 phylogenetic position, size comparisons, as well as general information on dinosaur
387 evolution and paleontology. Finally, there is *Mimo on the dinosaur trail* (Mazan et al., 2016)

388 about the results of the dinosaur excavation in Angeac-Charente, France. The
389 ornithomimosaur Mimo and his carcharodontosaur friend Hector face an unknown danger
390 together. The Cretaceous ecosystem is introduced as this story develops. After the comic
391 section with text blocks and speech bubbles, making up almost half of the volume, there is
392 an illustrated outline of the fauna followed by an account in sketchbook form of the real
393 excavation with explanations of the work steps and an introduction of the human
394 participants.

395

396 1.4 Graphic novels as a tool for teaching science

397 Today, paleoart is the most commonly used medium to communicate paleontological topics
398 to the public. It can not only provide ideas about the ecosystems of the past, but it can also
399 help to increase interest in them (Berta, 2021). Therefore, it is obvious to use this medium of
400 science communication in the form of a graphic novel. Research institutions address diverse
401 target groups and educational levels in order to interest a broad audience in their research
402 activities and findings. In this way, they break down barriers—including invisible ones such
403 as language barriers—and can offer scientific content in a way that engenders equal
404 opportunities and self-determined participation (Leidner, 2007; Metzger, 2016). Through this
405 form of inclusion, every individual level of receptivity, needs, and knowledge are equally
406 addressed in a format-friendly manner. Interested readers can thus approach specialized
407 topics from different perspectives. This enables readers to independently experience content
408 and gain knowledge. Simultaneously, it helps the pursuit for greater inclusion in our society
409 (Abel and Klein, 2016; Wong et al., 2016; Metzger, 2016).

410

411

412

413 Our sensory nervous system is stimulated by a variety of sensory data. In that process, our
414 senses automatically and constantly carry out selection processes of incoming information
415 (Kahlert, 2000). Graphic novels are especially suited to focus our attention on specific
416 senses. Images, in particular, often show something unexpected and can either complement
417 or challenge prior knowledge, which in turn can trigger emotions and increase interest.
418 Books and images can thus be used creatively as didactic material in the classroom. For
419 example, a graphic novel with a scientific background may serve as a valuable
420 complementary tool in the classroom, even when not directly related to the curriculum
421 (Tatalovic, 2009).

422

423 Museum and collection knowledge transfer necessitates creating access to knowledge
424 through a variety of aesthetic forms of presentation. These forms range from dioramas and
425 room-filling illustrations to graphic literature such as graphic novels with page-filling images
426 with little to no text. The latter can increase interest in technical topics as well as improve
427 reading comprehension (Abel and Klein, 2016; Wong et al., 2016). Moreover, a graphic
428 novel finds its readership among adults and yet does not exclude children, teens, and
429 families because very little text comprehension is required (Abel and Klein, 2016; Wong et
430 al., 2016). Haptic experiences with paper are often described by children as authentic and
431 real, and therefore preferred for learning, as compared to viewing digital books (Sax, 2016).
432 The latter ultimately remains dependent on the technology used and its availability.

433

434 Studies show that comics are suitable for teaching natural sciences to children (e.g.,
435 Farinella, 2018; Spiegel et al., 2013; and references therein). Even the often difficult-to-reach
436 target group of young adults (often referred to as the ‘virtual’ generation in the age of
437 smartphones and digital media) can be addressed by means of graphic novels (Yang, 2008).
438 Young adults are stimulated in their imagination by the illustrations and receive the content
439 through independent exploration (Tatalovic, 2009, Short et al, 2009). The general suitability
440 for a diverse community of interest within a wide variety of backgrounds lies in the anchoring
441 of comics in everyday life (Tatalovic, 2009). This broad audience wants to be met by
442 adequate forms of communication and be encouraged to think about scientific content
443 (Tatalovic, 2009).

444

445 Barrier-free access can be achieved by offering at least two sensory styles (‘two-senses
446 principle’; Metzger, 2016): an illustrated book with a reduced amount of text (for example an
447 exhibition catalog) can be picked up repeatedly and continues to function as a mediator
448 while creating memories. The combination of images and reduced text also supports student
449 learning (Wong et al., 2016). Science communication can use this ‘multimedia approach’ to
450 communicate topics with a lasting effect, especially since much more information can be
451 conveyed in a picture than in a length-limited text. Graphic novels can increase interest in a
452 topic through this interplay of image and text (Wong et al., 2016).

453

454 However, illustrations can still leave room for misinterpretation (Wong et al., 2016) and are
455 therefore often only a complementary element to the communication of knowledge. This
456 element, created through the collaboration of artists and scientists, gains credibility and
457 authenticity in interaction with original objects, dioramas, and reconstructions (Klein, 2004;
458 Berta, 2021). Whereas dioramas or individual drawings tend to ‘freeze’ a particular moment
459 in time (Abel and Klein, 2016), a continuing story in a graphic novel allows for a change in

460 perspective and better represents the multi-faceted nature of extinct organisms and
461 ecosystems.

462

463 2 The EUROPASAURUS graphic novel: defining a new niche 464 of scientific credibility in graphic novels

465 2.1 Motivation

466 As laid out in section 1.4, graphic novels possess several benefits for science
467 communication. In other natural sciences, the use of such educational graphic novels is
468 more widespread. Environmental sciences, for example, lead the way. They do not only
469 cover the climate crisis (e.g., Squarzoni and Whittington-Evans, 2014) but also general
470 environmental work (e.g., Bertagna and Goldsmith, 2014), waste problems such as the
471 Great Pacific Garbage Patch (Allison, 2012; Harris and Morazzo, 2013), severe changes in
472 the biosphere (Kurlansky and Stockton, 2014), or suggestions of personal changes to
473 reduce the carbon footprint (Dávila, 2011).

474 While guide books for the creation of graphic novels exist (e.g., McCloud, 1993; McCloud,
475 2006), together with countless online blog posts and videos, we (OW, JK, HA, AMP, JF) did
476 not use any of them actively in the creation of our book. Strangely, however, special
477 literature regarding the creation of educational graphic novels does not seem to exist. To
478 remedy this situation, we would like to share what we learned in creating our graphic novel
479 and from a survey among the readers of this book.

480 The origin of our graphic novel lies in the active science communication that was carried out
481 continuously during a paleontological research project about the dinosaur *Europasaurus*
482 (see section 2.2). This science communication involved not only regular press releases
483 about new discoveries and technical articles, but also talks as well as guided tours at the
484 actual excavation site. The idea for a graphic novel was born after several years of
485 exchange with the interested public. Our plan was to create a colorful work that would be
486 both exciting and scientifically plausible. Hence, this approach falls into the “Genre potpourri”
487 in dinosaur comics from section 1.3. Most similar is the approach in *Mimo on the dinosaur*
488 *trail* (Mazan et al., 2016), which has a similar purpose and presents the excavation results
489 from Angeac-Charente in western France (Allain et al., 2022) with its diverse flora and fauna
490 in an age-appropriate way. There are significant differences in content and style, but the
491 overall aim of immersive presentation of excavation results is remarkably identical. At the
492 time of the EUROPASAURUS graphic novel's idea development, however, *Mimo* was not

493 known and thus served neither as a template nor inspiration. It shows, however, that
494 different people can independently develop similar ideas for transferring knowledge.
495 We decided on several basic parameters: 1) a documentary approach without
496 anthropomorphized main characters, 2) a calm narrative style, and 3) the integration of
497 scientific facts and references to actual fossil finds. Because only dinosaur books up to
498 elementary school age were available on the German book market, our goal was to reach an
499 older audience while also attempting to close the gap towards the specialized literature.
500 However, the target group of our book was all people interested in the geological past, visual
501 media, and/or illustrated works. Special focus was given to children from about ten years,
502 teenagers, and young adults, who often seem to have outgrown their ‘dinosaur enthusiasm’
503 from early childhood. These young readers are able to experience the life of dinosaurs
504 visually and enjoy easily accessible media content such as graphic novels and digital motion
505 comics. Readers are required to have little or no prior knowledge of the subject. The content
506 is easily understood through the narrative in pictures and aims to spark interest in more
507 information. Even without reading the text, the book’s design allows readers to follow the
508 story. The focus of a graphic novel is of course on the graphic narrative part, but at the same
509 time, background information in the appended factual section includes state of the art
510 research results in easy language. From the beginning, the book was planned to be
511 German-English bilingual in order to expand the readership beyond a German-speaking
512 audience. With these ideas in mind, we developed several research questions and
513 addressed them in an online survey (see section 2.3).

514

515 2.2 Scientific background

516 The *Europasaurus* Project researches one of the most important Mesozoic sites for fossil
517 vertebrates in Europe—the Langenberg Quarry at the northern rim of the Harz Mountains
518 near Goslar in Lower Saxony, Germany. The peculiarity of this site is the inclusion of fossils
519 of terrestrial vertebrates such as lizards (Richter et al., 2013), crocodylomorphs (Schwarz et
520 al., 2017), pterosaurs (Fastnacht, 2005), the dwarf sauropod dinosaur *Europasaurus holgeri*
521 Sander et al., 2006 (Carballido and Sander, 2014; Marpmann et al., 2015; Carballido et al.
522 2020), and theropod dinosaurs (Lallensack et al., 2015; Gerke and Wings, 2016; Evers and
523 Wings, 2020), which are limited to a few layers next to commonly occurring marine fossils
524 (Wings and Sander, 2012). The vertebrate remains were transported into the shallow marine
525 depositional environment during the Kimmeridgian (Late Jurassic, about 154 million years
526 ago; Zuo et al., 2018). At that time, Europe was still a tropical archipelago. The terrestrial
527 fossils came from a nearby island and, in addition to land plants, include predominantly the

528 remains of dinosaurs but also many other vertebrate groups. Bones and teeth of the small
529 sauropod dinosaur *Europasaurus* are particularly common. With a maximum height of three
530 meters and a length of eight meters, this macronarian sauropod was much smaller than its
531 closest relatives, who rank among the largest land animals of all time. Food sources of
532 *Europasaurus* were probably limited on the island, which may have led to island dwarfism
533 over time—a recurring pattern throughout evolution (Sander et al., 2006). The discovery of
534 the first Jurassic mammals in Germany (Martin et al., 2016, 2019, 2021a, 2021b) and a
535 number of other new taxa added to the success story of this research project. The large
536 number of unusual and well-preserved fossil finds, which due to their often fragmentary
537 nature reveal little to non-specialists, asked for a visual reconstruction of the living world of
538 that time. A grant for innovative high-profile scientific outreach allowed the realization of a
539 special project: the graphic novel *EUROPASAURUS - Life on Jurassic Islands* (Wings and
540 Knüppe, 2020), presenting the results of many years of research on fossil organisms from
541 Langenberg and their Late Jurassic ecosystem in an easily accessible form.

542

543 2.3 Methods & Ethics

544 Because several of our ideas and reasoning in creating this graphic novel were rather
545 guesswork than solid facts, we decided to ask our audience some questions via an online
546 survey.

547 The background to the survey was centered around the following questions:

- 548 1. Are graphic novels as analogue media generally of interest and is this interest age-
549 dependent?
- 550 2. In the opinion of the interviewees, are graphic novels suitable for conveying (natural)
551 scientific content?
- 552 3. In the opinion of the interviewees, are bilingual graphic novels also suitable for teaching a
553 foreign language?

554 Almost two years after the publication date of the book, we started to address these
555 questions in an online questionnaire. Fortunately, it was possible via Social Media to reach
556 out to a large number of readers and an online survey was designed using Google Forms.
557 The aim of the anonymous online survey was to record the general impressions of the
558 graphic novel in terms of its design and structure on the recipients. Furthermore, the
559 suitability of the book for conveying scientific content and foreign language skills was
560 evaluated. The survey was carried out as a questionnaire with mostly 5-point Likert scales.

561 The collected data were processed using Microsoft Excel and evaluated with the statistical
562 software pspp with regard to Pearson correlation (r) of the scales and significance (p), with
563 $0.5 < |r| \leq 0.8$ for a clear linear connection and $0.8 < |r| \leq 1.0$ for high to perfect linear
564 connection of the scales. A p -value < 0.05 is considered significant. In addition, the
565 participants had the opportunity to verbally formulate comments regarding three other
566 aspects: (1) Is there anything in the book that particularly stuck in your mind? If yes, what
567 was that? (2) What did you like the most? (3) What could still be improved? The answers to
568 these open questions were addressed in a thematic analysis. Furthermore, we started a
569 preliminary thematic analysis of the reviews of the book on the Amazon website.
570 All information was treated as strictly confidential in accordance with the EU General Data
571 Protection Regulation (GDPR) and according to the guidelines of the Department of
572 Didactics of Biology at the Martin Luther University of Halle-Wittenberg. All research results
573 and survey information were only used in an anonymous form, the identification of individual
574 participants in the questionnaire is impossible.

575

576 2.4 Survey results

577 A total of 152 persons participated in the survey (see supplement for complete dataset). This
578 number is well above the recommended minimum number of 120 samples for statistical
579 analyses and thus allows 90% confidence intervals for the endpoints of the normal range
580 (Reed et al., 1971). The majority (69.7%) of the participants were male. Of all participants in
581 the survey, more than half (52.3%) consider themselves to have very good knowledge of
582 paleontological topics, another quarter of the participants (25.2%) estimated their
583 paleontological knowledge still as good.

584 Surprisingly, the age structure of the participants was quite mixed (Fig. 9a), with the group of
585 16-25-year-old making up over a third (37.5%) and those over 25 making up just over half
586 (54.6%). Most readers read the book several times (Fig. 9b). The frequency of engagement
587 with the book was not dependent on age ($p=0.577$). The basic interest in graphic novels or
588 comics (Fig. 9c) is also not significantly ($p= 0.325$) age-dependent among the test persons.
589 Within this sample, overall rating ($r=0.037$; $p=0.652$), extent of prior knowledge ($r=-0.105$;
590 $p=0.202$), and interest ($r=-0.125$; $p=0.126$) were found to be equally independent of age.

591 The estimated increase in knowledge through the graphic novel (Fig. 9d) of the remaining
592 22.5% of the respondents with no or little prior knowledge, however, differed only marginally
593 from that of the entire sample (3.45 vs. 3.46 in the mean). Therefore, an increase in
594 knowledge can be assumed for all respondents to about the same extent, which then,
595 however, probably refers to different, previously unknown areas. Overall, 16.4% of the

596 respondents found the graphic novel interesting and 80.9% even very interesting. An almost
597 identical picture emerged from the evaluation of the book in the form of awarding stars (* -
598 worst evaluation, ***** - best evaluation), with 82.5% awarding five stars and 15.8%
599 awarding four stars.

600 Regarding the suitability of graphic novels for science communication, over 96% of the
601 participants found it to be a useful (15.8%) or very useful (80.9%) tool for knowledge transfer
602 (Fig. 9e). This underlines the applicability of graphic novels for knowledge transfer, as
603 significantly fewer participants indicated a great (28.3%) or very great (28.9%) interest in
604 these media when asked for their general interest in graphic novels or comics (Fig. 9c). An
605 extremely high significance was shown with the participants, who indicated a basically large
606 interest in comics and graphic novels, these evaluated this book as very interesting
607 ($p=0.000$). The extent of the factual part was considered to be enjoyable by most readers
608 (Fig. 9f).

609 A preference for the native language, both in the graphic and in the factual part of the book,
610 could be recognized. However, about a third of the participants (29.6%) read also all texts of
611 the graphic part in the other language, with the factual part, it was still about a quarter of all
612 participants (23.7%). The bilingualism of the book as a whole was evaluated by the
613 predominant number of the survey participants as a good (20.4%) or very good idea (64.5%)
614 (Fig. 9g). Furthermore, about two thirds see the bilingualism as rather positive for the
615 learning of a foreign language (36.2% beneficial and 32.9% very beneficial) (Fig. 9h). There
616 was a strong correlation between engagement with graphic and factual sections in the
617 foreign language ($r=0.89$).

618 With regard to the assessment of the appropriateness of the pricing, at least the test persons
619 who gave high ratings felt that the book was appropriately priced ($p=0.000$) and would buy it
620 again or recommend it to others ($p=0.000$). The situation was different when respondents
621 were asked if they would look at the book with children. Even though 52.6% of the
622 respondents would definitely look at the book with children and 30.3% stated that this was
623 still likely, there was no dependence on the general evaluation ($p=0.716$, $r=0.030$).

624 In addition to the survey, the participants had the opportunity to verbally comment on three
625 different aspects of their engagement with the graphic novel. The first question related to
626 scenes or sections in the book that were particularly memorable. 108 participants
627 commented on this. From the responses, the following categories of design or plot were
628 highlighted based on the frequency of mentions (more than 10 mentions). Frequent positive
629 statements about the design referred to the realism or detail of the drawings (22 mentions;
630 20.4%), while 21 mentions (19.4%) emphasized the artistic design in the form of different
631 perspectives and views. The depiction of the biodiversity of living creatures was also felt to
632 be particularly impressive (16 mentions; 14.8%). In addition, many different individual

633 depictions were mentioned, the most common of which was the depiction of the
634 thunderstorm (pages 72-75, 20 mentions; 18.5%).

635 The second question was aimed directly at what single aspect the participants liked best.
636 Among the 120 responses, more than ten mentions each fell into four main categories: The
637 quality of artistic representations was mentioned by 59 (49.2%) participants, 22 (18.3%)
638 participants particularly highlighted the representation of biodiversity, 21 (17.5%) participants
639 liked the factual part the most, and 12 (10%) people preferred the story.

640 97 participants also answered the last question, which asked for suggestions for
641 improvement. In this regard, 42 people (43.3%) stated that they could not make any
642 suggestions for further improvement in terms of complete satisfaction with the graphic novel.
643 A more extensive factual section was recommended by 10 persons (10.3%), while two
644 persons (2.1%) felt it was too long. Another five people (5.1%) suggested even more panels.

645 On the Amazon webpage, the EUROPASAURUS graphic novel has as of now (November
646 11th, 2022) 44 ratings with an average score of 4.6 out of 5 stars. Fourteen customers left
647 written reviews, of which nine originated in Germany, two are from Great Britain, two from
648 the USA and one from Japan. Among the twelve non-professional reviews, four positively
649 emphasized the bilingualism, eight praised the content approach (scientific background,
650 story, topic), and four commented positively on the factual part (stirring interest, appreciation
651 of the scientific elaboration). Two reviewers appreciated the scientifically correct
652 representation of the actual processes, especially the (bloody) acquisition of food by
653 predators via hunting prey whereas also two people doubted the correct representations
654 (e.g.: of the animals). Regarding the possible target group, four reviewers suggest everyone
655 who likes dinosaurs (including adults) while also four reviewers see it as suitable preferably
656 for children at least six/seven years old. One person was inspired to look into the fossil site
657 and planned to visit it. Two reviews recommended the book to others or did buy it again.
658

659 2.5 Discussion of survey results

660 Based on the results of this survey, the research questions formulated at the outset (see
661 section 2.3: Methods and Ethics) can be answered as follows: graphic novels, and this book
662 in particular, meet with a very high level of interest due to both the quality of the design and
663 the structuring of the content, and this is independent of both the age and prior knowledge of
664 the readers. In the opinion of the interviewees, graphic novels are quite suitable for
665 conveying scientific content and, at least in this case, lead to a clear increase in knowledge
666 among both pre-educated persons and laypersons. Moreover, bilingualism is seen as a good
667 means of teaching a foreign language.

668 However, it should be noted that the selection of test persons does not represent a random
669 cross-section of recipients, but that the participants decided to participate voluntarily and
670 thus possibly have a generally higher interest in graphic novels and/or paleontology.

671

672 2.6 Storytelling with facts and fiction: The balance between 673 entertainment and scientific accuracy

674 For an especially vivid impression of this Jurassic ecosystem, the situations and behaviors
675 shown in the images were chosen to be as diverse and visually creative as possible. In
676 addition to fossil finds, analogies and comparisons with living animals and comparable
677 habitats, as well as examples from the history of art and paleoart, served as inspiration. For
678 example, the painting *Der Abend* by Caspar David Friedrich served as an initial inspiration
679 for the composition of a forest scene at dawn, while the colors in this picture were mostly
680 inspired by classic landscape paintings of Edwin Church (Fig. 10). A storm scene (Fig. 11) is
681 a loose homage to the sea paintings by William Turner and Winslow Homer, while clouds on
682 the following page can partially be traced back to influences by Albert Bierstadt (Fig. 12).
683 Overall, the work of the Hudson River School, a group of landscape painters that included
684 Church and Bierstadt (Avery et al., 1987), left an impression on many pages of the graphic
685 novel. On the paleoart side, the work of Douglas Henderson was an important inspiration,
686 especially his handling of light and shadows, structure of the images but also, for example,
687 his use of dead wood. Additionally, major paleoart influences came from John Gurche's,
688 John Conway's, Mark Hallett's, and Todd Marshall's works.

689

690 We hoped that the graphic novel (although inevitably rendered outdated sooner or later by
691 scientific advances) would provide a visually and intellectually appealing medium that will
692 continue to excite future generations about the fossil flora and fauna of the Langenberg
693 Quarry and paleontology in general.

694 The plot of the story revolves around the experiences of a juvenile individual of
695 *Europasaurus*. Interwoven with subplots of various protagonists such as a series of
696 predatory dinosaurs, marine crocodiles, turtles, pterosaurs, small mammals, lizards, and
697 dwarf land-dwelling crocodyliforms, the story thus provides an overview of the entire
698 ecosystem. Major events such as a storm, a lightning strike, and a fire serve as overarching
699 plot highlights.

700 Due to the demand for scientific accuracy in the presentation (in contrast to a classic comic
701 book), only limited means were available to create an emotional connection between the
702 story's main character and the reader. Neither dialogue can be conveyed with typical comic

703 speech bubbles, nor should emotions in the animals be portrayed in a pronounced way.
704 Therefore, to bind the reader to the main character and create empathy, 'fictional' elements
705 of the so-called 'hero's journey' were used. At the beginning, the hero, a young
706 *Europasaurus*, lives comfortably under the care of the herd. A stroke of fate leaves the
707 protagonist on its own. The young animal must outgrow itself and continue on its way alone.
708 Although the course of this plot is fictional, it always remains realistic and plausible. For
709 example, a lightning strike as depicted killing the herd in our book is considered the most
710 plausible scientific explanation for the *Europasaurus* bone bed (Wings and Knüppe, 2020),
711 which contains remains of at least 21 individuals representing all ontogenetic stages (Scheil
712 and Sander 2017).

713

714 2.7 Storytelling with pictures: How to find a unique style

715 From the beginning, a hybrid between comic book style and non-fiction book detailed
716 paleontological illustrations was planned. The square format of the book unfolds to double
717 pages in wide format. Each double page was used in full size for a basic illustration showing
718 a core message (Fig. 13A). In this basic illustration, small comic panels are placed that
719 either advance the plot or provide further insights into the ecosystem. Occasional text blocks
720 offer further information. We refrained from using a typical comic panel-to-panel structure on
721 a white background and the distinctive hand-lettered black font set in white speech bubbles
722 or boxes. Instead, all design elements were subordinated to the overall impression of the
723 double pages and later adapted for a visually balanced outcome (Fig. 13B).

724 Our goal during the course of the story was to display the broadest possible spectrum of
725 different color and light moods in order to present them in a visually interesting way,
726 reaching a length of around 140 pages (around 70 double pages).

727 Time of day, weather, landscape, and flora as well as the change from wide settings (such
728 as landscapes) to detailed representations of small animals were used to create constantly
729 new image themes in accordance with the storyline. The dramatic composition and
730 representation of the main elements of the story essentially controls how long the reader
731 stays in such a world of pictures, colors, and moods.

732 This principle becomes evident on the first 18 double pages (Fig. 14): We started with a
733 picture dominated by black, showing the earth from a distance during a sunrise (1). We
734 'open the curtain' and accompany a marine crocodyliform *Machimosaurus* on its journey
735 from the ocean (2–3) through a river delta (4) into the hinterland of an island. There in a lake,
736 the individual first fights (5–6) and then mates (7). On pages 2 and 3, deep blue tones depict

737 the ocean, which then gradually merge into green colors, illustrating the inland areas. The
738 mating takes place in the 'romantic' warm light of a sunset (7). The first seven double pages
739 illustrate the behavior of the *Machimosaurus* over the course of a day. During the night, the
740 small multituberculate mammal *Teutonodon* meets a sleeping (dying) *Machimosaurus* (8).
741 Now the focus switches to *Teutonodon*, and we accompany it on its prowl through the night
742 (9–11) until the mammal reaches its den, where it takes care of its offspring and falls asleep
743 among them (12–13). The nocturnal images are mostly implemented in close-up views with
744 detailed depictions. In contrast, the following dawning new day is introduced in a large wide-
745 angle landscape shot (14). The subsequent four double pages show the *Europasaurus* herd
746 near the mammalian den. The story continues on a sunny day in a light forest dominated by
747 green (plants) and yellow (ground) colors (15–18).

748 From the beginning, all images were planned and created to stand alone (i.e., without text) in
749 order to use the visual medium to its maximum effect. In some places where short
750 explanations could contribute to a better understanding of the storyline, reduced text was
751 added to the sequence of images in a final production step. The factual section following the
752 narrative graphic novel part explains the main scientific results of the *Europasaurus* Project
753 in an easily understandable way. Its bilingualism (German/English) ensures easy access of
754 an international audience to the background information.

755

756 2.8 How to maximize awareness: Social media and exhibitions

757 The book was published in November 2020. It contains 184 pages, 38 of which comprise the
758 scientific background. At the same time the book was published, social media activities on
759 various channels (Twitter, Instagram, Facebook, and YouTube) were started for promotion.
760 We also provided free access to half of the book's content on YouTube as animated motion
761 comic videos. In four episodes, short stories about different organisms in the ecosystem of
762 the time are told: episode 1 deals with the marine crocodyliform *Machimosaurus*, episode 2
763 with the small nocturnal mammal *Teutonodon*, episode 3 with *Europasaurus* and predatory
764 ceratosaurs, and episode 4 focuses on a natural disaster that probably took place at that
765 time and caused the mass occurrence of fossil bones. Each of the four videos is available in
766 English and German versions. The free online access helps to achieve a large international
767 distribution (link to the first English episode on YouTube: <https://youtu.be/ftkxBgQJsIM>).
768 Beyond presentation in digital media, the detailed life restorations beg to be presented on a
769 larger scale in the context of exhibitions. Some *Europasaurus* works were already on display
770 in the special exhibition 'KinoSaurier' at the Lower Saxon State Museum Hannover,

771 Germany, and the Natural History Museum in Vienna, Austria. Overall, the responses to the
772 graphic novel have been very positive, and we hope that through our work we can also
773 contribute to a better understanding of prehistoric times in Germany.
774

775 2.9 Insights into the production process

776 A small team of people, whose different professions complemented each other, created the
777 graphic novel *EUROPASAURUS – Life on Jurassic Islands*. Vertebrate paleontologist Oliver
778 Wings, an expert on the fossil biota of the Langenberg locality including *Europasaurus*,
779 provided the scientific background. Paleoartist Joschua Knüppe illustrated press releases
780 about the newly described taxa from the Langenberg Quarry for several years, providing him
781 with a solid base of knowledge for this project. Knüppe created a total of 275 detailed
782 illustrations for the comic section and a further 80 illustrations for the factual section of the
783 book. Media designer and art director Henning Ahlers was responsible for the consistency of
784 the narrated story, done through ‘visual storytelling’ with a continuous arc of suspense and a
785 coherent color scheme. Museum educator Arila Perl took care of the design and typesetting
786 of the entire book. The creation of the book took a total of three years from the conception of
787 the first chapter to the final print. Up to two dozen versions of storyboards for the respective
788 storyline were created in advance before the final version of the illustrations were
789 implemented as elaborate acrylic paintings. Due to the spatial separation of the team, video
790 conferences were the primary form of communication. Even before the pandemic, these
791 online meetings took place several times a week.

792 After collecting ideas and determining a first rough plot, storyboard sketches were created
793 (mostly on brown paper) in order to precisely indicate the arrangement of light and shadow
794 (Fig. 15). These early storyboards served as the basis for further discussions to detail and
795 refine the story. Especially in the later developmental stages, traditional sketches were
796 combined with digital ones, allowing the team to witness and discuss their creation through
797 screen sharing.

798 Once the compositions and story of a section were finalized, the sketches were transferred
799 onto large paper. Each double page was painted in 58.5 x 29.5 cm format, larger than their
800 final book printing in order to ensure a higher detail density. During the early creation of the
801 chapters, the base coat of paint was applied with large brushes. However, this often led to
802 uneven color gradients and noticeable brushstrokes, especially with darker tones.
803 Eventually, we switched to the use of small synthetic sponges for the application of the first
804 layers of paint. On top of these, a rough sketch of the composition was drawn and the first

805 shapes of flora and fauna blocked in, starting with the scenery and ending with the main
806 focal points of the painting. Here, a mixture of gouache, acrylic paints, watercolors, and
807 colored pencils was used. After shapes and shadows were depicted, details like skin
808 patterns and textures were added. This later stage often went through a few discussions to
809 ensure consistent quality and effectiveness of the compositions. After the drawing stage was
810 complete, final digital high-resolution scans of the picture were produced accompanied by a
811 first rough color correction, retouches, and sometimes further digital enhancement. The final
812 step before publication consisted of detailed retouches (digitally removing dust particles,
813 etc.) as well as color and brightness corrections. The front flyleaf (Fig. 16) as well as two of
814 the double pages (Figs .17, 18) give examples of the final outcome.

815

816 3 Conclusion and Outlook

817 Since their scientific discovery almost 200 years ago, dinosaurs and other extinct taxa have
818 always inspired our imagination, and they will likely continue to do so in coming generations.
819 Their common appearance in pop culture provides an unparalleled opportunity for
820 transmitting paleontological research to the public. Projects like the *EUROPASAURUS – Life*
821 *on Jurassic Islands* graphic novel provide the means to correct common misconceptions of
822 fossil organisms, their interactions, and former ecosystems in the public eye.
823 Such publications also combine useful sources of information and fun in education. We hope
824 that our experiences may inspire others to create similar works on other paleontological
825 topics or even other disciplines of geoscience. This is further underlined by the past success
826 of comics about past worlds and their inhabitants, whether as adventure, illustrated science
827 book, or self-narrative documentary.

828

829 Data availability

830 Data were collected from the available comic and graphic novel literature. We acquired
831 permissions for the depicted images from the current copyright holders to the best of our
832 knowledge. Most works are still publicly accessible to purchase.

833

834 Author contributions

835 OW, JK, HA and JF conceptualized and designed the EUROPASAURUS graphic novel, AP
836 carried out the typesetting of the book. OW and JF developed the idea for this article. JF
837 provided the initial review of comics and graphic novels, JK the section on paleoart, AP the
838 section about teaching science with graphic novels, OW, JK, HA wrote the section on the
839 EUROPASAURUS graphic novel. JF, HA, JK, and OW prepared the figures for the article.
840 OW, JF and SK designed the questionnaire which was evaluated by SK. OW and JF
841 prepared the draft and edited several pre-publication manuscripts with contributions from all
842 other authors.

843

844 Competing interests

845 The authors declare that they have no conflict of interest.

846

847 Acknowledgements

848 In preparing this article, considerable time was spent in obtaining the necessary permissions
849 to reproduce copyrighted material in this open access article in order to allow the reader to
850 experience the various comics with their merits and peculiarities. We sincerely hope that we
851 have not overlooked any claims, and would like to thank the many people, artists, and
852 publishers for further information and generous permissions to use their graphics in our
853 article. We thank in alphabetical order: Anja Adam (Egmont Ehapa Media, Berlin), Verena
854 Arzmilller (Carlsen Verlag, Munich), Matteo Bacchin (Milan), Mandy Barr (DC Comics, New
855 York), Saskia Baumgart (Bulls Pressedienst, Frankfurt am Main), Bradford W. Berger (First
856 Classics, Inc., Pioneertown), Meghan Chan and Kari Torson (Dark Horse Comics,
857 Milwaukie), Ricardo Delgado (Los Angeles), Achim Dressler (Bocola Verlag, Klotten),
858 Eckhard Friedrich (Bildschriftenverlag, Hannover), Tadd Galusha (Anchorage), Abby Howard
859 (Charlotte), Irene Kahlau and Helga Uhlemann (Tessloff Verlag, Nürnberg), Mike Keeseey
860 (Los Angeles), Jim Lawson (Chesterfield), Robert Löffler (MOSAİK Steinchen für Steinchen
861 Verlag, Berlin), Ted Rechlin (Rextooth Studios, Bozeman), Max Schlegel (Splitterverlag,
862 Bielefeld), Mark Schultz (Clarks Summit), Stephanie Steinmetz [The Walt Disney Company
863 (Germany), Munich], Stephen R. Bissette (Vermont), Rosemary Volpe and Erin Gredell
864 (Peabody Museum of Natural History, Yale University), Rostislav Walica (Prague), Cathy

865 Wilbanks (Edgar Rice Burroughs, Inc., Los Angeles), and Nadine Winns (Abbeville Press,
866 New York).
867 Brian Andres (University College Birmingham) and Larry Rhinehart (Albuquerque) are
868 acknowledged for corrections and comments on earlier versions of this manuscript. Andreas
869 Stark (University Halle-Wittenberg) helped with the thematic analysis. We are grateful to the
870 editor John K. Hillier as well as the reviewers Jeff Liston (Royal Tyrrell Museum of
871 Palaeontology, Canada) and Victoria Coules (University of Bristol, UK) for their helpful
872 comments that put the final touches on the manuscript. Moreover, we thank the Volkswagen
873 Foundation for funding the *Europasaurus* Project and the creation of the graphic novel. The
874 Dinosaurier-Park MÜNCHENHAGEN, Nils Knötschke as well as Fabian and Janna von Pupka
875 supported and permitted our field work.

1425

1426 **Figure 13:** (a) Example of a final double page in the book; (b) Schematic structure of this
1427 double page: The structure of the basic illustration and the movement of the *Europasaurus*
1428 herd correspond to the usual "western" reading direction from left to right. The reader starts

1429 in the familiar way of looking at the top left and following the diagonal direction of action
1430 across the center of the picture to the bottom right (1). As graphical compensation, two inset
1431 panels were placed at the bottom left, which in turn are set from left to right in their reading
1432 direction (2). The left panel is placed behind the right panel, supporting the desired reading
1433 order. The panels illustrate a detail as well as another perspective of the action in the basic
1434 illustration. When designing double pages, it is always important to ensure that the area in
1435 the middle of the picture does not contain crucial information, as this might otherwise be lost
1436 during binding of the book (3). The text block in the upper right corner (4) provides additional
1437 graphic balance. The necks of the sauropods point up to the text block. They represent the
1438 last element in the sequence of perception on the double page. The text offers additional
1439 information about the action of the herd action, namely their motivation. Horizontal lines,
1440 resulting from the surf, the beach and the tree line, stabilize the overall presentation of the
1441 double page with its otherwise diagonal impression (© Wings & Knüppe 2020).

1442

1443 **Figure 14:** The color scheme of the first 18 double pages of the book. Changing the dark
1444 distance view at the beginning into deep blue, and later green colors. A warm sunset light
1445 closes the first day, followed by dark night scenes. The second day starts again with warm
1446 colors, whereas green and yellow dominates the landscapes on the following pages. For
1447 more explanation, see main text (© Wings & Knüppe 2020).

1448

1449 **Figure 15:** The evolution of storyboard sketches sometimes included many different
1450 versions for a particular scene. This double page combines the end of a turtle hatchling
1451 storyline with the introduction of (swimming) torvosaurid theropods (© Wings & Knüppe
1452 2020).

1453

1454 **Figure 16:** The front flyleaf of the book introduces all larger vertebrates in the same scale (©
1455 Wings & Knüppe 2020).

1456

1457 **Figure 17:** This double page shows *Europasaurus* individuals during feeding on the shore.
1458 One individual is feeding on kelp which offered the opportunity to show some of the shallow
1459 marine organisms too (© Wings & Knüppe 2020).

1460

1461 **Figure 18:** This double page shows the juvenile *Europasaurus* moving through a horse tail
1462 forest. Some eupterodactyloid pterosaurs are hitching a ride (© Wings & Knüppe 2020).

1463

1464 **Supplement Information**

1465 Complete set of questions used in the Questionnaire about Europasaurus Graphic Novel
1466 (PDF-file)

1467 Dataset containing all Questionnaire answers (Excel-file). The first sheet contains the raw
1468 dataset, the second sheet contains the same data processed for PSPP.

1469 The supplement figure (PNG-file) is suggested as the possible cover image for the highlight
1470 article. If selected, the copyright is: © Wings & Knüppe 2020, 2023.
