Table S1

Figures S1 to S4

Table 1. Statistical parameters for HONO fluxes at 12h intervals. PFP: pre-fertilization period (before June 18); HEP: high HONO emission period (from June 18 to July 10); LEP: low HONO emission period (after July 10).

Flux (ng N m ⁻² s ⁻¹)	PFP		HEP		LEP	
	NP	CK	NP	CK	NP	CK
AVG	0.54	-0.51	97.7	-0.36	1.03	-2.88
SD ^a	0.35	0.13	8.6	0.04	3.17	2.41
MAX ^b	0.91	0.44	319	1.78	8.15	1.68
MIN ^c	-0.05	-1.65	-1.14	-3.29	-5.52	-8.55

a: SD represents the standard deviation between the three duplicates in parallel.

^{b, c}: MAX and MIN represent the maximum and minimum values of the observed HONO flux.

Figures

Figure S1. Correlation between the measured $J(\text{NO}_2)$ and solar radiation (August 28–September 30, 2021).

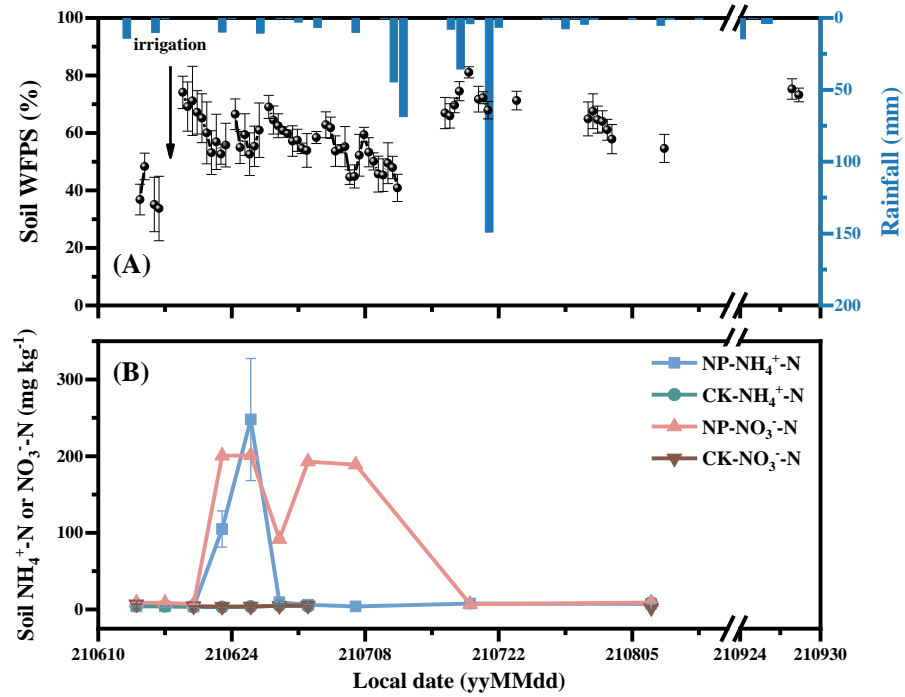

Figure S2. Variations of soil water-filled pore space (WFPS) and rainfall (A), concentrations of soil $\text{NH}_4^+\text{-N}$ and $\text{NO}_3^-\text{-N}$ from the NP (chemical N fertilizer + normal irrigation), and CK (no fertilization but with normal irrigation) plots (B) during the maize growing season. Error bars represent the standard deviations ($n=5$ for soil WFPS and 3 for soil $\text{NH}_4^+\text{-N}$ and $\text{NO}_3^-\text{-N}$ concentrations).

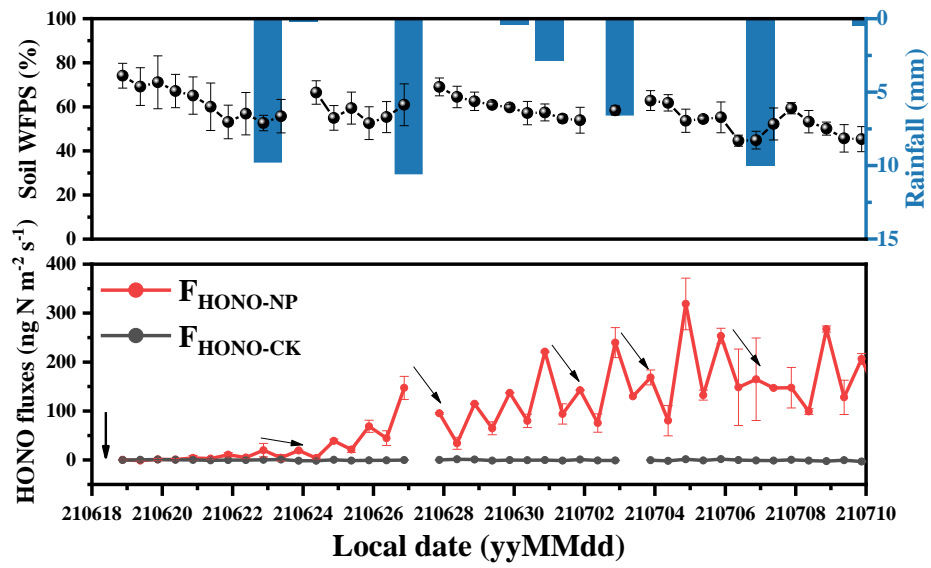

Figure S3. Influence of rainfall on soil HONO emissions and soil water-filled pore space (WFPS).

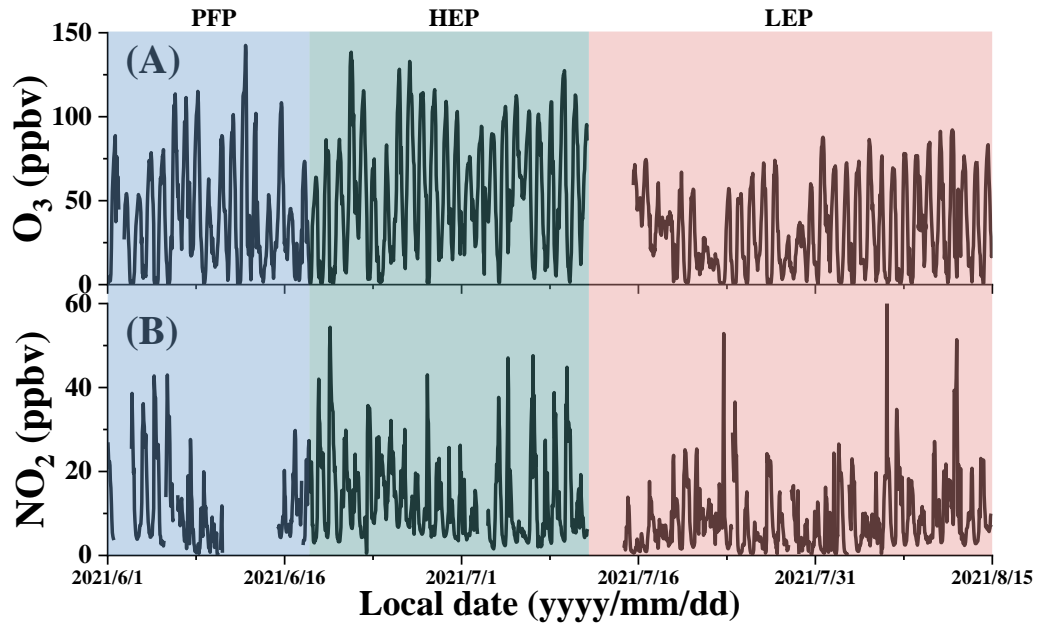

Figure S4. Time series of atmospheric O₃ (A) and NO₂ (B) concentrations at the observation site from June 1 to August 15, 2021.
