Firstly, I would like to thank the authors for thoroughly addressing my comments. The revised manuscript is a really interesting read and helps to better understand the response of the Elbe estuary to SLR and topographic changes. While reading the revised manuscript, I only stumbled upon some minor (technical) issues that the authors might consider to address before publication. Nevertheless, I am happy to endorse the manuscript for publication. My comments/suggestions are listed below:

1) Line 72: Suggestion: "This can in turn lead […]" instead of "This can in turn led […]".

2) Line 87: Shouldn't it be "time-dependent" instead of "time-depended"?

3) Line 110: Suggestion: "[…] estuary […]" instead of "[…] estuariy […]".

4) Some of the figures seem to have rather low resolution. The authors might consider to use a higher resolution for their figures. If this issue was only caused by the compression of images during the generation of the pdf-file, this comment might be neglected.

5) Full stops are missing at the end of many figure/table captions.

6) Figure 5: Why is the station "Scharhörn" shown in this figure? This station is never mentioned in the entire manuscript. Accordingly, the station shouldn't necessarily be highlighted in this figure.

7) Line 247: Suggestion: "[…] key parameter […]" instead of "[…] keyparameter […]".

8) Line 373: Suggestion: "[…] a SLR […]" instead of "[…] an SLR […]".

9) Line 472: Suggestion: "[…] changes in intertidal […]" instead of "[…] changes in of intertidal […]".

10) Line 477: Suggestion: "[…] in the estuary." instead of "[…] in estuary.".

11) Line 481: Suggestion: "[…] in estuary cross-sections […]" instead of "[…] in an estuary cross-sections […]".

12) Line 531: Suggestion: "[…] gradual convergence […]" instead of "[…] gradually convergence […]".
