S1. Materials and reagents

Hydrogen peroxide solution in water ($\geq 30\%$, ultra-trace, no stabilizers added), (–)-Menthol ($\geq 99\%$), (\pm)-exo,exo-2,3-Camphanediol($\geq 97\%$), (+)-Borneol ($\geq 98\%$), 1,2-Butanediol ($\geq 98\%$), 1,2-Propanediol($\geq 99\%$), 1,4-Butanediol ($\geq 97\%$), 1,6-Hexanediol ($\geq 99\%$), 1-Butanol ($\geq 99\%$), 1-Heptanol ($\geq 99\%$), 2-Butanol ($\geq 99\%$),
40 cis-2-Methylcyclohexanol ($\geq 98\%$), 1-Decanol($\geq 99\%$), Dimethyl phthalate ($\geq 99\%$), 1,2-Ethanediol ($\geq 99\%$), 1-Heptanol ($\geq 98\%$), 1-Hexanol ($\geq 98\%$), 1-Octanol ($\geq 99\%$), 1,3-propanediol ($\geq 98\%$), 3-ethyl-3-pentanol ($\geq 97\%$)and
45 Sodium sulfate, anhydrous fine powder was purchased from Sigma-Merck (Schnelldorf, Germany). 1-Propanol ($\geq 98\%$) and Ethanol ($\geq 99\%$)were purchased from Avantor Performance Materials (Gliwice, Poland). (+)-Fenchol ($\geq 96\%$), and 1-Nonanol ($\geq 99\%$) were purchased from Alfa Aesar; Chemat (Gdańsk, Poland). 1,5-Pentanediol ($\geq 95\%$)was purchased from AmBeed; Chemat (Gdańsk, Poland). 1,10-Decanediol ($\geq 98\%$), 1,7-Heptanediol ($\geq 98\%$), 1,8-Octanediol ($\geq 98\%$), 1,9-Nonanediol ($\geq 98\%$), trans-1,2-Cyclohexanediol ($\geq 99\%$) were purchased
50 from Angene; Chemat (Gdańsk, Poland). 1-Pentanol (99%) was purchased from Aros; Chemat (Gdańsk, Poland).
(1S,2S,3R,5S)-(+)-Pinanediol ($\geq 99\%$) and sodium chloride, extra pure were purchased from Thermo; Chemat (Gdańsk, Poland). Deionized (DI) water ($18 \text{ M}\Omega \times \text{cm}^{-1}$) was prepared using Direct - Q3 Ultrapure Water System (Millipore). UHP gases: zero-air ($\leq 3 \text{ ppm}$ of H_2O and $\leq 0.1 \text{ ppm}$ of hydrocarbons), hydrogen ($\geq 99.999 \text{ \%}$), and, helium ($\geq 99.999 \text{ \%}$) were supplied by Multax (Stare Babice, Poland).

S2. Gas chromatography analysis conditions

S2.1. Gas chromatography coupled with the mass spectrometry

GC/MS analyses were carried out using GC/MS-QP2010 Ultra gas chromatograph coupled with a single quadrupole mass spectrometer (Shimadzu) equipped with the electron ionization (70 eV) ion source. The instrument was equipped with an AOC-5000 autosampler (Shimadzu). This instrument was used to analyze two sets of cyclic and terpene alcohols and diols (Table S1).

The first group of alcohols was analyzed using VF-WAXms column (Agilent); 30 m, 0.25mm, 0.5 μ m stationary phase. The column head pressure was 32.3 kPa, the total flow of the carrier gas (He) was 16.1 ml/min, the column flow was 0.67 ml/min (30 cm/sec), purge flow was 2 ml/min. The linear velocity flow control mode was used and the split ratio was 20. The injector, ion source, and mass spectrometer transfer line temperatures were 250°C. The following temperature program was used: initially, 70 °C was held for 4 min, then linear increase at the rate of 150 °C/min to 250°C, kept for 6 min, and analysis time was 22 min.

The second group of cyclic and terpene alcohols, containing (\pm)-exo,exo-2,3-camphanediol, and pinanediol was analyzed using the ZB-5MSplus column (Zebron); 30 m, 0.25mm, 0.5 μ m stationary phase. The column head pressure was 27.2 kPa, the total flow of the carrier gas (He) was 16.4 ml/min, the column flow was 0.68 ml/min (30 cm/sec), purge flow was 2 ml/min. The linear velocity flow control mode was used and the split ratio was 20. The injector, ion source, and mass spectrometer transfer line temperatures were 280°C. The following temperature program was used: initially, 50 °C was held for 2 min, then linear increase at the rate of 16 °C/min to 70°C, kept for 8 min, then linear increase at the rate of 10°C/min to 250°C, kept for 1 min analysis time was 30 min.

S2.2. Gas chromatography with the flame-ionization detector

GC/FID analyses were carried out using a GC17A capillary gas chromatography coupled with the flame-ionization detector (FID) and equipped with the AOC20i autosampler (Shimadzu). This instrument was used to analyze two groups of AAs (Table S2).

The temperatures of the injector and detector were 250°C. Analytes were separated with a ZB-Waxplus capillary column (Phenomenex), 30 m, 0.25mm, 0.5 µm stationary phase. The column was connected (from the injector side) with a 1 m retention gap (pre-column) of 0.25mm, untreated fused silica (no stationary phase). The retention gap was used to protect the length of the column placed in the injector from degradation and activation by water vapor combined with a high injector temperature.

1 µl of the ethyl acetate extracts (C₅-C₁₀ linear alcohols and diols, cyclic and terpene alcohols) were injected into the instrument. The column head pressure was 101 kPa, the column flow of the carrier gas (He) was 1.4 ml/min (30 cm/s), purge flow was 2 ml/min. The linear velocity flow control mode was used. Samples were injected in splitless mode (sampling time 0.5 min, then split ratio 1:14). The following temperature program was used: initially, 40°C was held for 3 min, then linear increase at the rate of 15 °C/min to 150°C, kept for 5 min, then linear increase at the rate of 20°C/min to 230°C, held for 4 min, then linear increase at the rate of 20°C/min to 250°C, held for 3 min; analysis time was 27.4 min.

C₂-C₅ linear alcohols and diols were analyzed by directly injecting 0.2 µl of the aqueous reaction mixture into the instrument. Such an approach was used due to the very low extraction recoveries obtained for the C₂-C₅ linear alcohols when liquid-liquid extraction with ethyl acetate was carried out (results now shown). The injector and detector were kept at 120 and 140°C for analyzing the aqueous samples, respectively. The column head pressure was 102 kPa, the column flow of the carrier gas (He) was 1.4 ml/min (31 cm/s), the purge flow was 2 ml/min, and the split ratio was 25. The column was initially kept at 35°C held for 5 min, then linear increase at the rate of 20°C/min to 220°C, kept for 3 min; the analysis time was 17.3 min.

Sample chromatograms for the alcohols under investigation are presented in Fig. S1-S4.

135

Figure S1: Sample chromatogram of the compounds listed in Table S1 (first set) acquired with the GC/MS instrument.

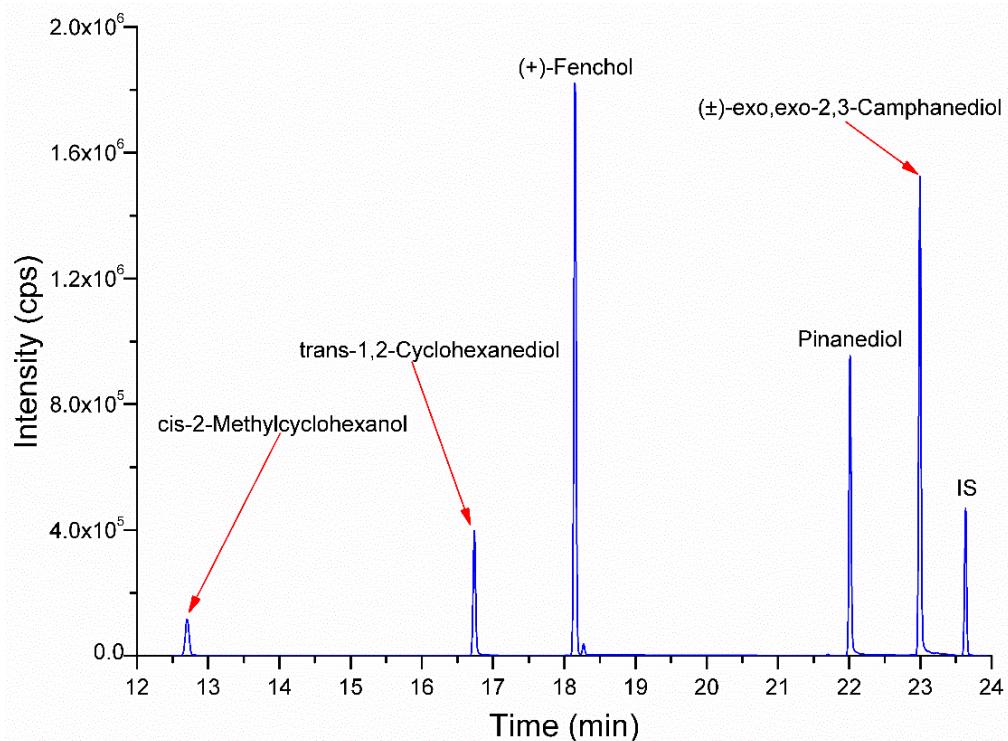

Figure S2: Sample chromatogram of the compounds listed in Table S1 (second set) acquired with the GC/MS instrument.

140

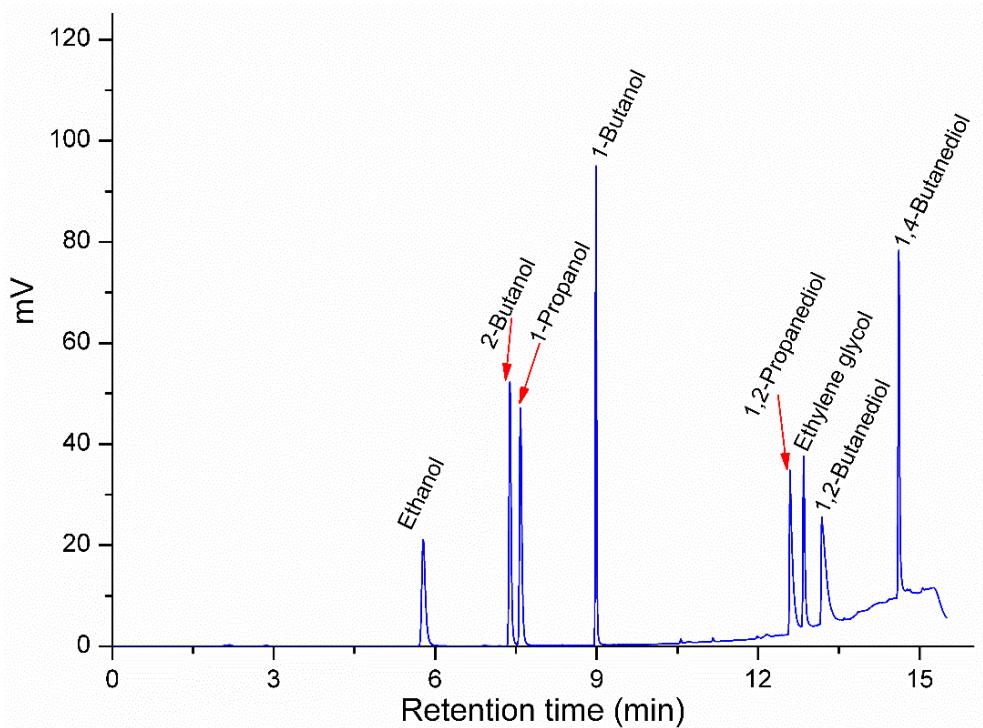

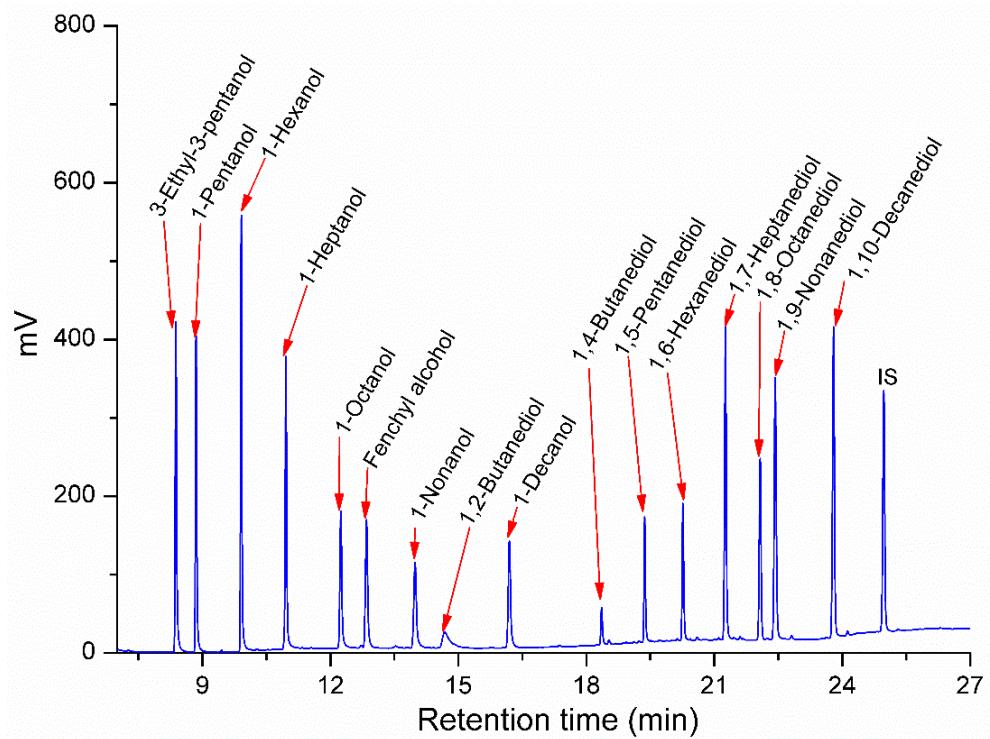

Figure S3: Sample chromatogram of the compounds listed in Table S2 (first set) acquired with the GC/FID instrument.

145

Figure S4: Sample chromatogram of the compounds listed in Table S2 (second set) acquired with the GC/FID instrument.

S4. Activation parameters

The E_a values obtained with eq. I (section 2.4 in the main text) were used to derive the activation parameters via eq. SI- SII:

150

$$\Delta H^\ddagger = E_a - R \cdot T \quad (\text{SI})$$

$$\Delta S^\ddagger = R \times \left(\ln(A) - \ln\left(\frac{k_B \cdot T}{h}\right) - 1 \right) \quad (\text{SII})$$

$$\Delta G^\ddagger = \Delta H^\ddagger - \Delta S^\ddagger \cdot T \quad (\text{SIII})$$

In eq. SI-SIII, ΔG^\ddagger is Gibbs free energy of activation, ΔH^\ddagger is the enthalpy of activation and ΔS^\ddagger is the entropy of activation, k_B and h are Boltzmann and Plank constants, respectively.

155

S5. Estimating the rates of the completely diffusion-limited reactions

The rates of the completely diffusion-controlled reactions of the AAs under investigation with the OH in the aqueous phase (k_{diff} , $\text{M}^{-1}\text{s}^{-1}$) were estimated with the Smoluchowski equation as previously described (Schöne et al., 2014; Schaefer et al., 2020; Witkowski et al., 2021). Initially, the group-contribution method was used to estimate the critical volumes (V_c , cm^3) (Joback and Reid, 1987). The V_c obtained was then used to derive molar volumes (V_m) for each AA (Joback and Reid, 1987). The V_m values calculated were used to calculate the values of radii (r , cm^{-1}), which were utilized to calculate diffusivities using a modified version of the Stokes-Einstein equation (Wilke and Chang, 1955). Finally, the r and D ($\text{cm}^2 \text{ s}^{-1}$) values were used to calculate the k_{diff} via the Smoluchowski equation – SIV.

$$k_{\text{diff}} = 4 \cdot 10^{-3} \cdot \pi \cdot N_A \cdot (r_{\text{OH}} + r_{\text{acid}}) \cdot (D_{\text{OH}} + D_{\text{acid}}) \quad (\text{SIV})$$

The k_{diff} values are estimated with eq. SIV are listed in Table S3 together with the estimated diffusion contributions

Table S3. Measured k_{OH} values, k_{diff} values at 298K, and the estimated diffusion contribution

Name	k_{OH} at 298 K, ($M^{-1}s^{-1}$) $\times 10^{-9}$		Diffusion contribution (%)
	Measured	k_{diff}	
Ethanol	1.95 \pm 0.07	14.1	14%
1-propanol	2.48 \pm 0.09	14.0	18%

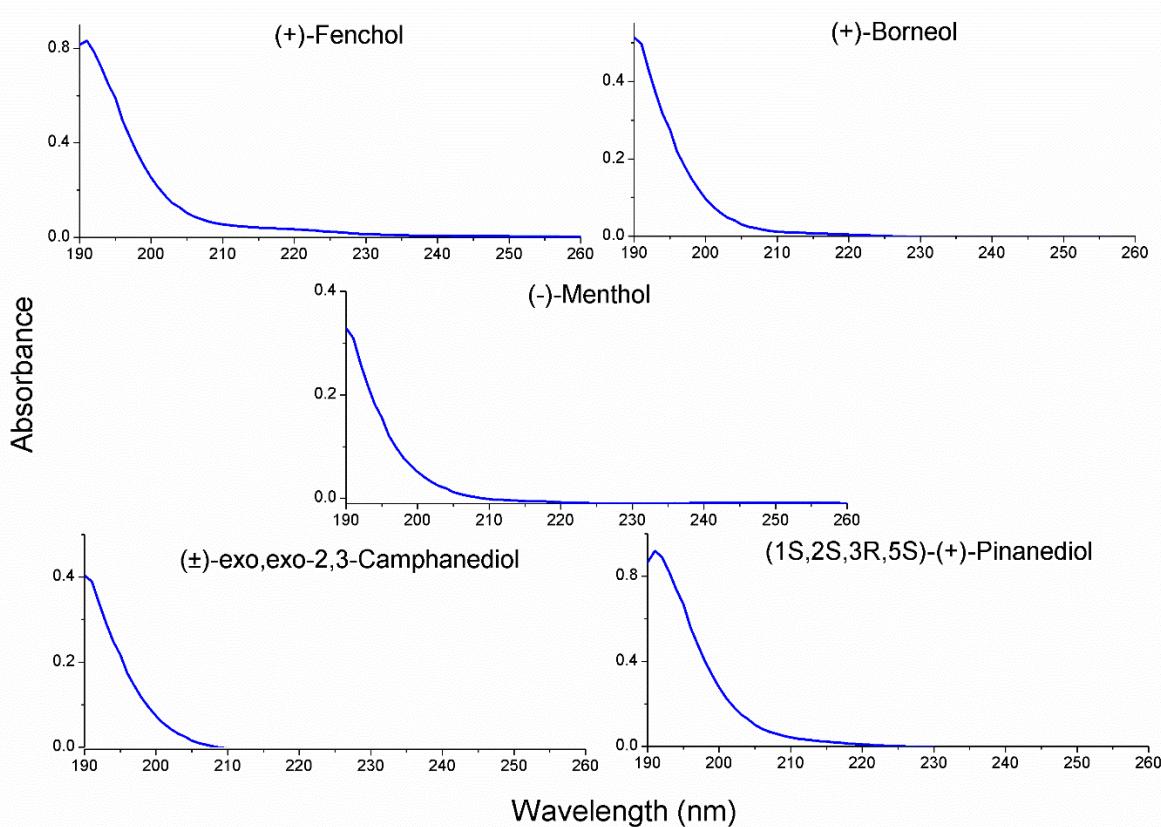

Figure S5: UV-Vis spectra of the terpenoic alcohols in water (concentration approx. 0.5 g/L each) and diols (concentration approx. 0.15 g/L each) investigated in this work.

As presented in Fig. S5, the terpenoic alcohols, and diols investigated in this work did not exhibit any absorbance above 220 nm, which is characteristic of other aliphatic alcohols and diols (Onori, 1987). Hence, it is reasonable to assume that these molecules did not undergo direct photolysis in the photoreactors (see section 2.1 in the main text).

Table S5. The previously measured values of $k_{OH_{gas}}$ and $k_{OH_{aq}}$ for n-alcohols and n-alkanes

Number of carbon atoms	Name	$k_{OH_{gas}} \times 10^{11}$ ($cm^3 molec^{-1} s^{-1}$)	Ref.	Name	$k_{OH_{gas}} \times 10^{11}$ ($cm^3 molec^{-1} s^{-1}$)	Ref.	$k_{OH_{aq}} (M^{-1} s^{-1})$ $\times 10^{-9}$	Ref.
n-Alcohols								
C₂	Ethanol	0.33	(McGillen et al., 2020)	Ethane	0.02	(McGillen et al., 2020)	1.60	(Hickel, 1975; Buxton et al., 1988; Getoff, 1989)
C₃	1- propanol	0.59	(McGillen et al., 2020)	Propane	0.11	(McGillen et al., 2020)	2.95	(Buxton et al., 1988; Getoff, 1991)
C₄	1-butanol	0.91	(Sime et al., 2020)	Butane	0.24	(McGillen et al., 2020)	4.60	(Buxton et al., 1988)
C₅	1- Pentanol	1.10	(Calvert et al., 2015)	Pentane	0.38	(McGillen et al., 2020)	5.40	(Buxton et al., 1988)
C₆	1- Hexanol	1.30	(Calvert et al., 2015)	Hexane	0.50	(McGillen et al., 2020)	6.60	(Buxton et al., 1988)
C₇	1- Heptanol	1.37	(Wallington et al., 1988; Nelson et al., 1990)	Heptane	0.62	(McGillen et al., 2020)	7.70	(Buxton et al., 1988)
C₈	1-Octanol	1.38	(Nelson et al., 1990; Calvert et al., 2015)	Octane	0.85	(McGillen et al., 2020)	9.10	(Buxton et al., 1988)
C₉				Nonane	1.02	(McGillen et al., 2020)		
C₁₀				Decane	1.31	(McGillen et al., 2020)		

Table S6. Performance of SAR (Model 2) for aliphatic alcohols, carboxylic acids, and (di)carboxylate anions in the temperature range between 278-328K.

Temperature (K)	Slope	R ²
278	1.1	0.738
283	1.0	0.638
288	0.90	0.736
293	0.97	0.529
298	1.1	0.750
303	0.98	0.666
308	0.85	0.702
313	0.82	0.631
318	0.86	0.687
323	0.88	0.656
328	1.55	0.423

Note that for different temperatures, a different number of $k_{OH_{aq}}$ are available for some molecules; for instance, only three rate coefficients in the training set were measured at 328K (Hoffmann et al., 2009).
