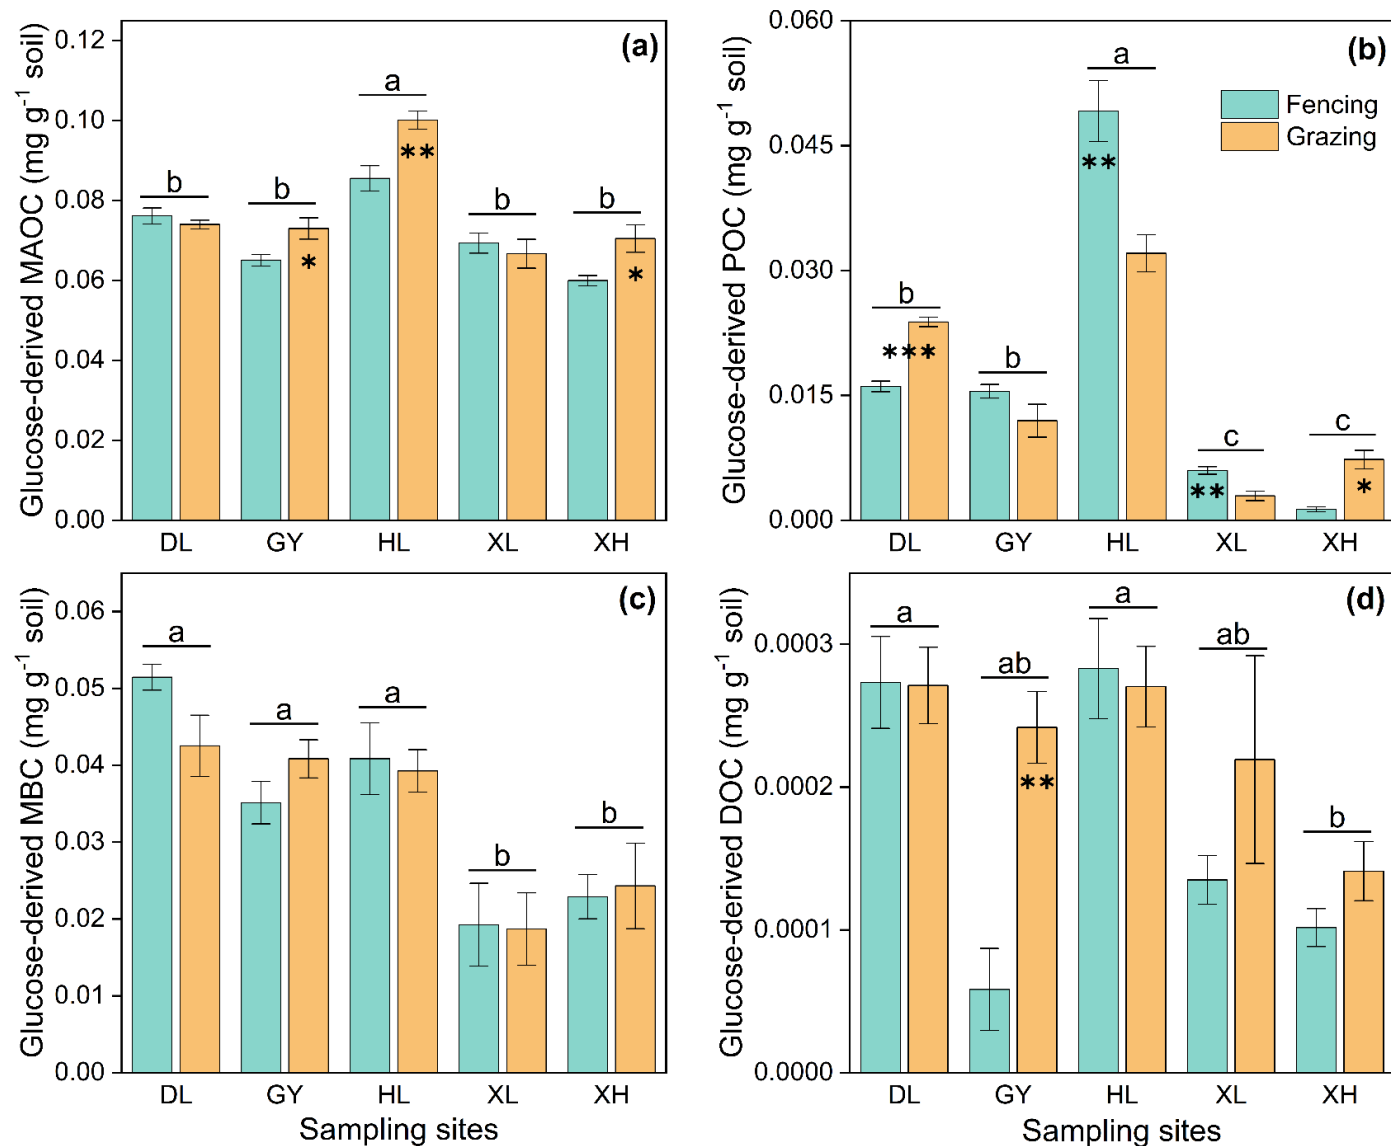

Figure S1. Response of carbon (C) sequestration to sites and fencing. a. Glucose-derived MAOC; b. Glucose-derived POC; c. Glucose-derived MBC; d. Glucose-derived DOC. Different letters above bars represent significant differences among sites ($P < 0.05$). Asterisks represent significant differences between grazing and fencing treatment (* $P < 0.05$, ** $P < 0.01$, *** $P < 0.001$).

Figure S2. Comparison of observed and modeled CO₂ flux in the incubation experiment. Diagonal black dotted line is 1:1 line.

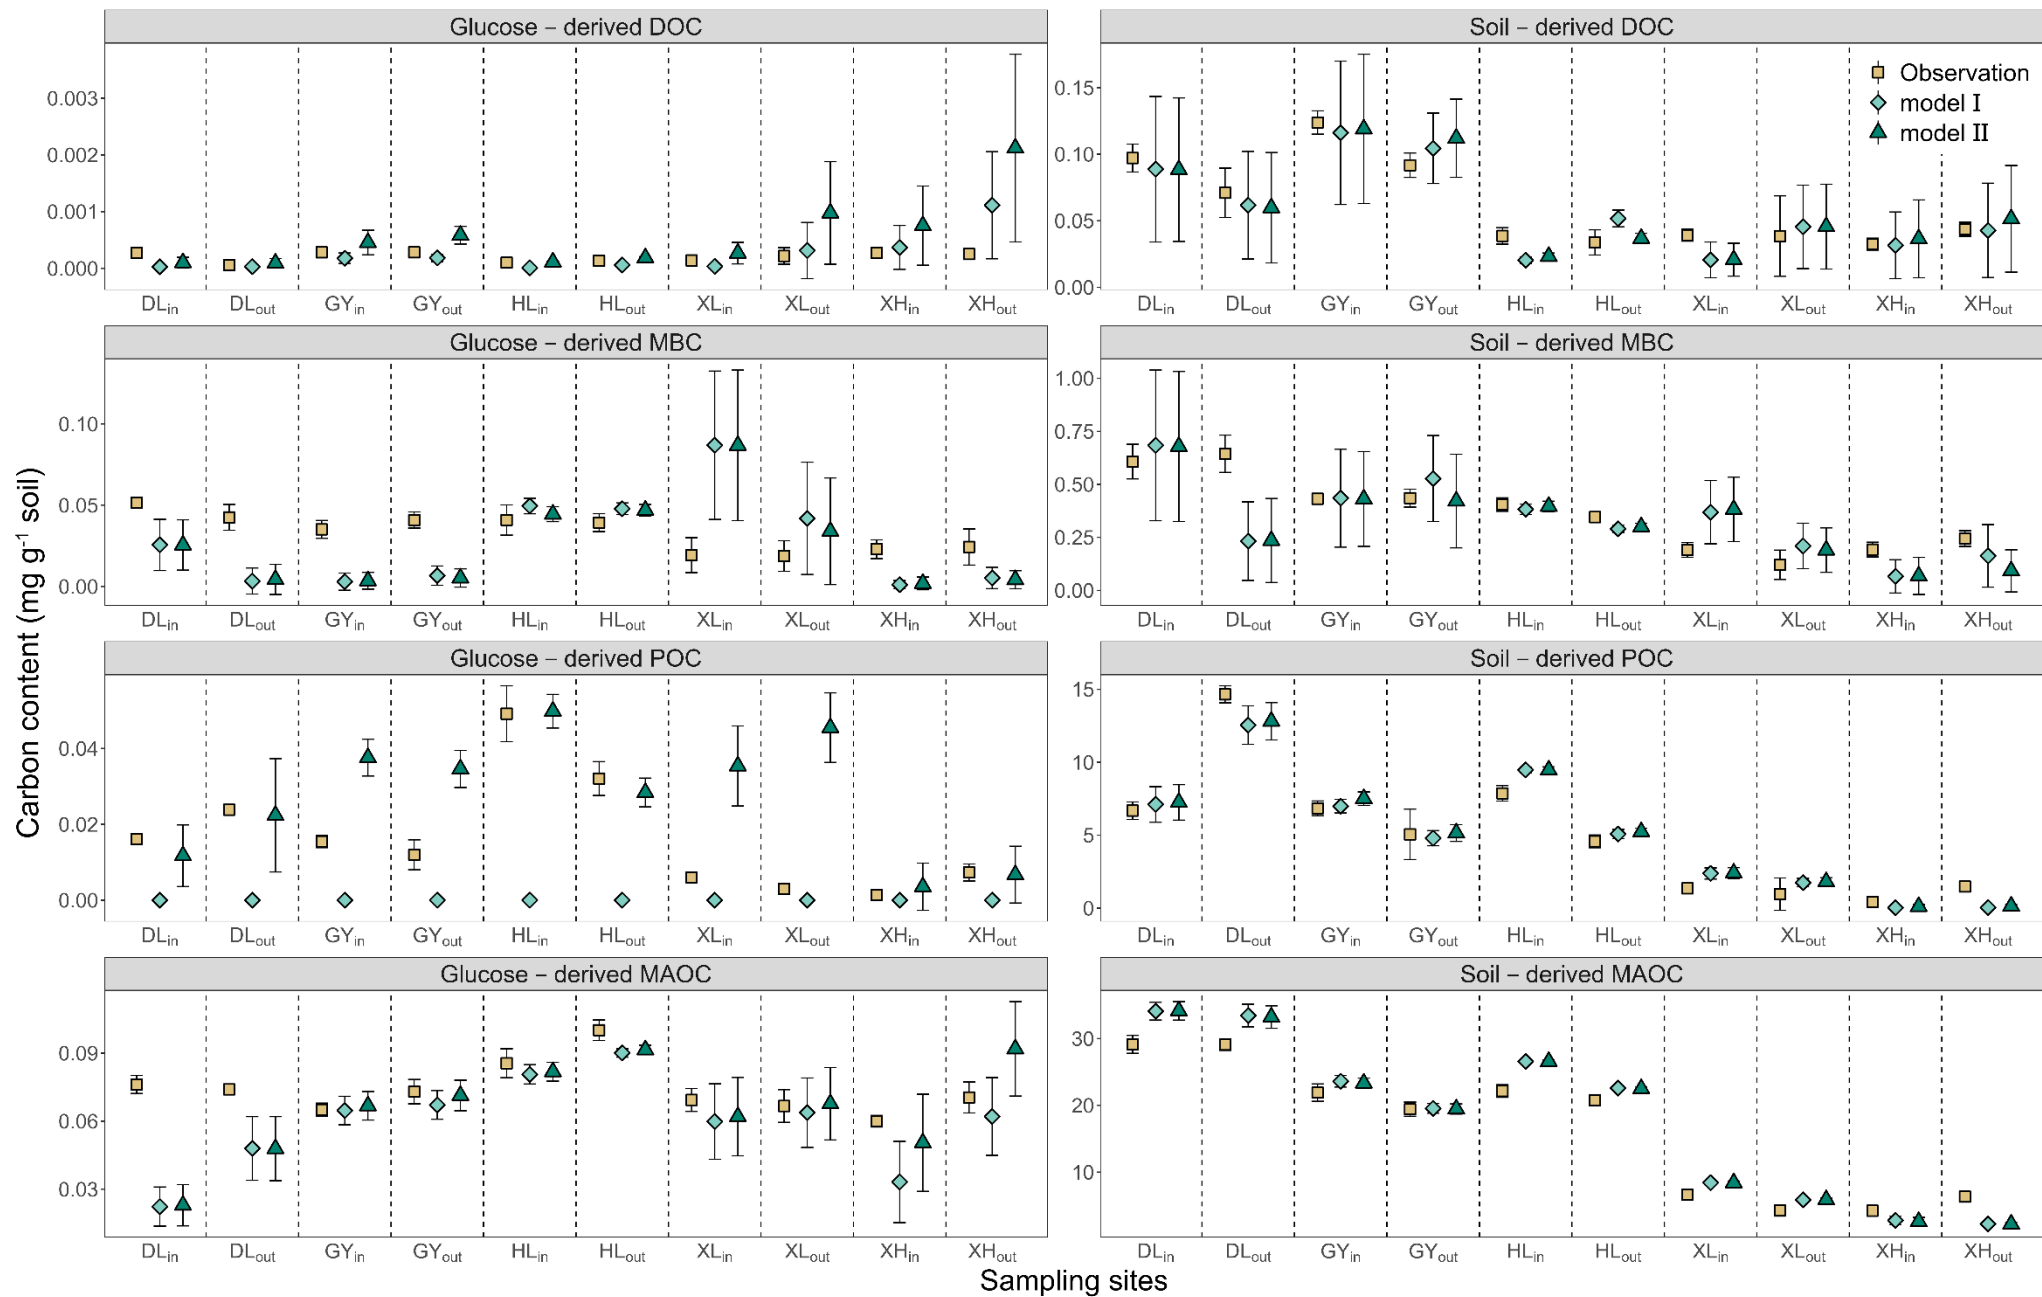

Figure S3. Observed and modeled soil C pools by Model I and II. The error bars represent the standard deviation of each dataset.

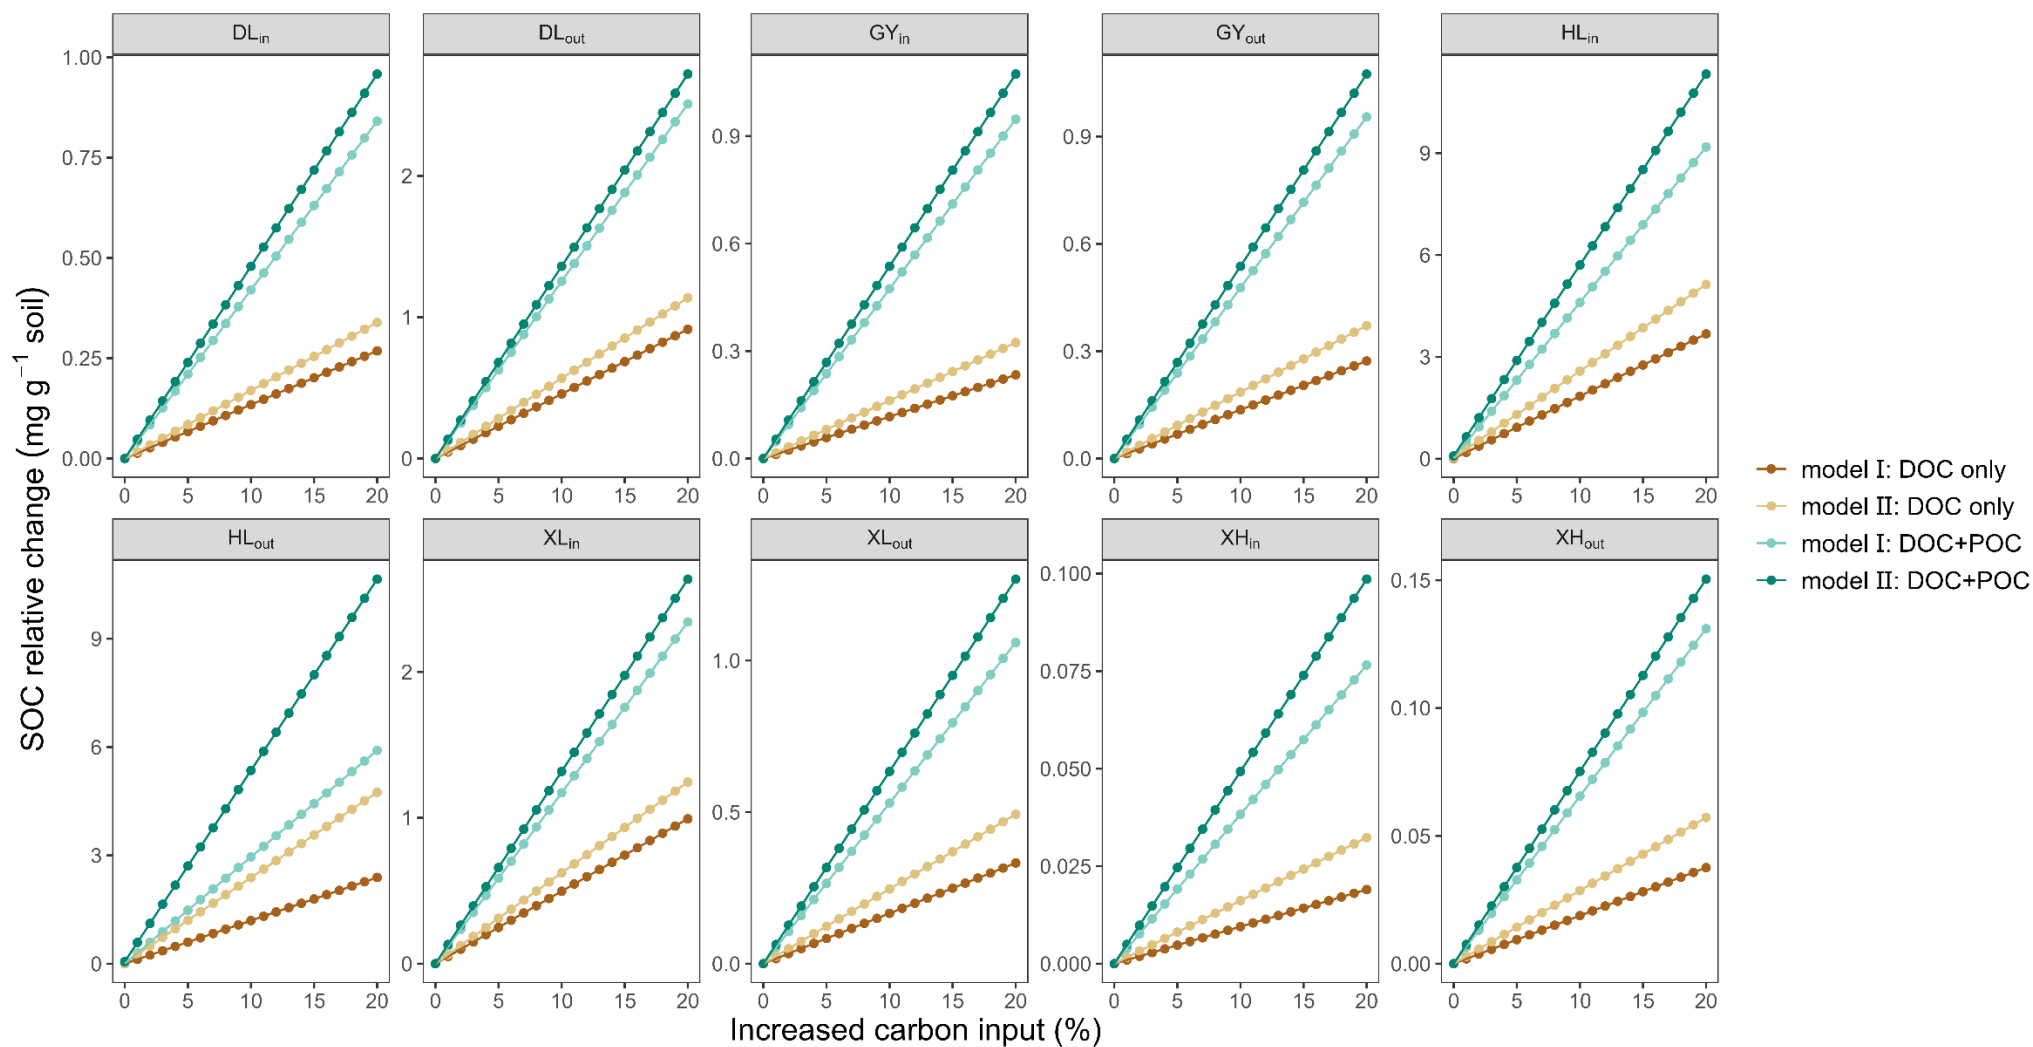

Figure S4. Continuous relative changes in the steady state along a gradient of C input increase under two types of C input conditions. C input increase from 1% to 20% with a 1% interval.

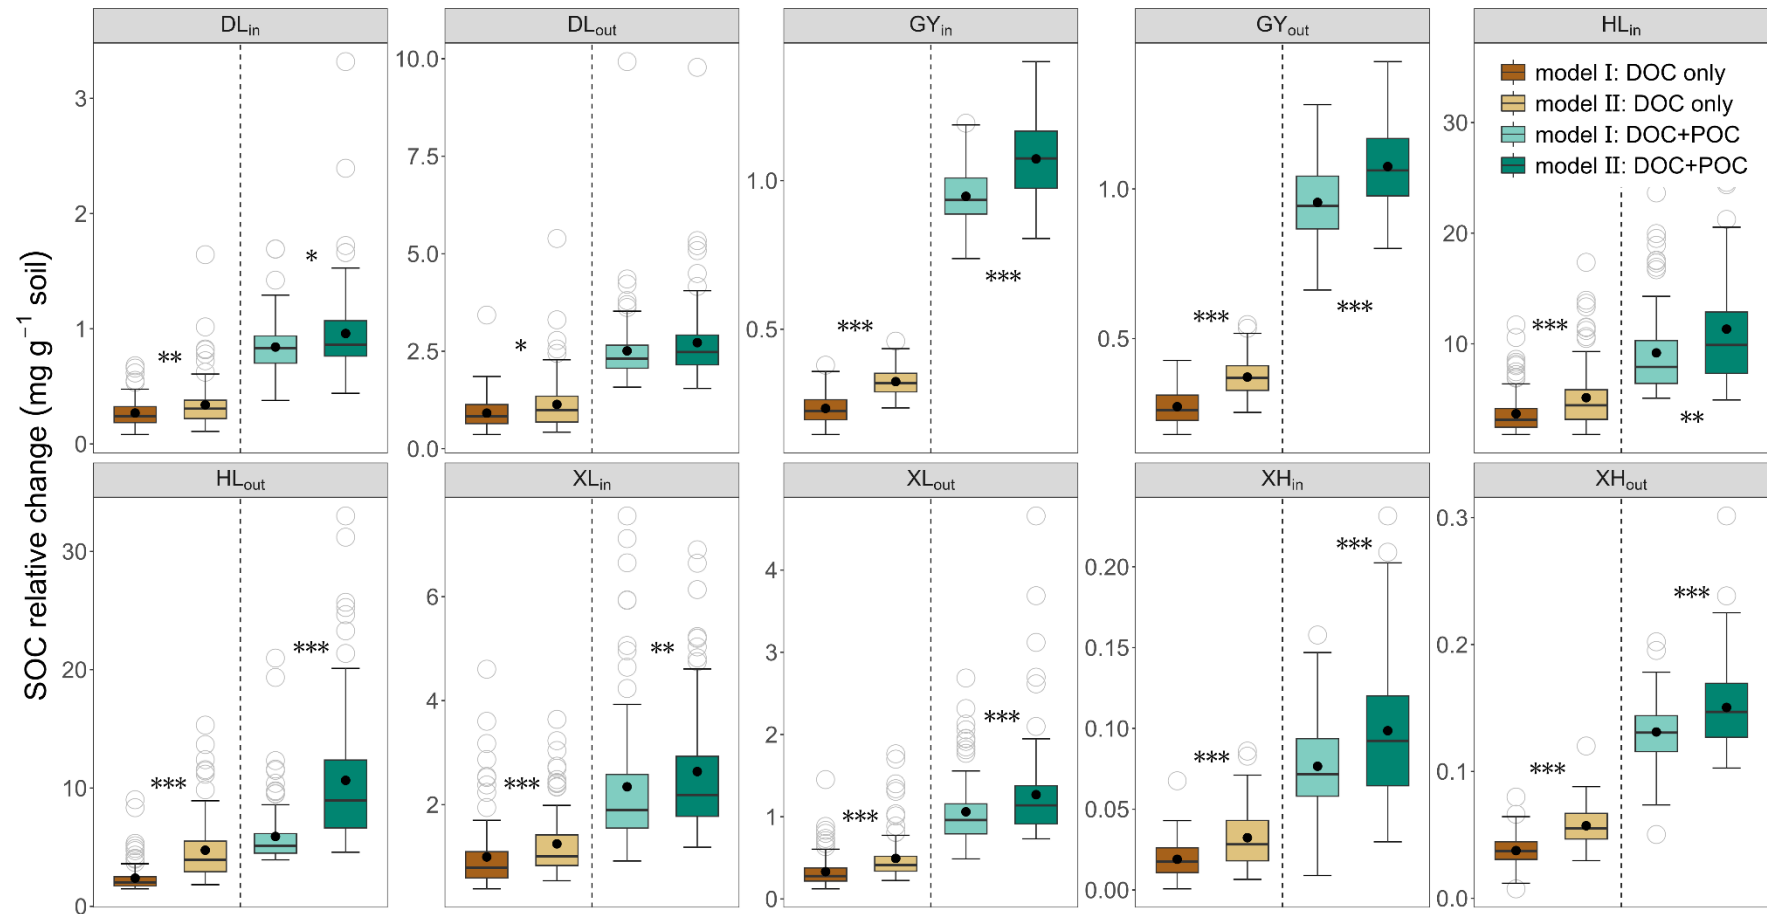

Figure S5. Relative changes in steady state at 20% C input increase under two types of C input conditions. The upper and lower ends of boxes denote the 0.25 and 0.75 percentiles, respectively. The solid line and solid dots in the box mark the median and mean of each dataset. Hollow dot denotes outliers.
