Abstract. Many atmospheric chemicals occur in the gas phase as well as in liquid cloud droplets and aerosol particles. Therefore, it is necessary to understand their distribution between the phases. According to Henry’s law, the equilibrium ratio between the abundances in the gas phase and in the aqueous phase is constant for a dilute solution. Henry’s law constants of trace gases of potential importance in environmental chemistry have been collected and converted into a uniform format. The compilation contains 46434 values of Henry’s law constants for 10173 species, collected from 994 references. It is also available on the internet at <https://www.henrys-law.org>. This article is a living review that supersedes the now obsolete publication by Sander (2015).

are needed to calculate the vaporization of contaminants, e.g., from rivers and during waste water treatment (e.g. Shen, 1982; Hawthorne et al., 1985; David et al., 2000).

Section 2 provides theoretical background about Henry’s law and commonly used quantities and units. In Sect. 3, the compilation of Henry’s law constants is described in detail. Additional information can be found in the electronic supplement, which is described in Sect. 4.

This article is a living review describing version 5.0.0. Compared to the now obsolete version 4.0 (Sander, 2015), the compilation contains 29084 additional values of Henry’s law constants for 5541 additional species, collected from 305 additional references. In cases where experimental data are available for a large temperature range, the values were refitted to a 3-parameter equation in addition to the 2-parameter fits that were used previously. The symbols of the Henry’s law constants have been adjusted in order to follow the new recommendations of the International Union of Pure and Applied Chemistry (IUPAC) by Sander et al. (2022). In addition to the CAS registry numbers, chemical species are now also identified by their InChIKeys (Heller et al., 2015).

1 Introduction

Henry’s law is named after the English chemist William Henry, who studied the topic in the early 19th century. In his publication about the quantity of gases absorbed by water (Henry, 1803), he described the results of his experiments:

“[...] water takes up, of gas condensed by one, two, or more additional atmospheres, a quantity which, ordinarily compressed, would be equal to twice, thrice, &c. the volume absorbed under the common pressure of the atmosphere.”

In other words, the amount of dissolved gas is proportional to its partial pressure in the gas phase. The proportionality factor is called a Henry’s law constant. In atmospheric chemistry, these constants are needed to describe the exchange of trace species between the air and liquid cloud droplets, aerosol particles, oceans and other bodies of water. In other areas of environmental research, the constants

2.1 Fundamental types of Henry’s law constants

There are many variants of Henry’s law constants which can all be classified into two fundamental types: One possibility is to put the aqueous phase into the numerator and the gas phase into the denominator, i.e., define the constant as the quotient A/G . Here, A and G are quantities describing the equilibrium composition (at infinite dilution) of the aqueous phase and the gas phase, respectively. Alternatively, the Henry’s law constant can be defined as the quotient G/A ,

^a The definitions apply only at equilibrium and in the limit of infinite dilution.

^b Here, $\text{M} = \text{mol L}^{-1}$ and $\text{atm} = 101\,325 \text{ Pa}$.

^c Here, $M_{\text{H}_2\text{O}}$ and $\rho_{\text{H}_2\text{O}}$ are the molar mass and density of water, respectively. M_B is the molar mass of the solute. The simplified conversion formulas are valid only for binary solutions and ideal gases. More conversion formulas can be found in Tab. 2 of Sander et al. (2022).

which results in the inverse value. There is no advantage or disadvantage in using one or the other, the two types exist purely for historical reasons. Unfortunately, the name ‘‘Henry’s law constant’’ is used for both types. Therefore, expressions like ‘‘a large Henry’s law constant’’ are meaningless unless the type is specified. Especially the dimensionless constants are very error-prone because their type cannot be deduced from the unit. In order to have a consistent terminology, the name ‘‘Henry’s law solubility constant’’ (or ‘‘Henry solubility’’ for conciseness) should be used when referring to A/G . When referring to G/A , the name ‘‘Henry’s law volatility constant’’ (or ‘‘Henry volatility’’) should be used.

2.2 Variants of Henry’s law constants

For both of the fundamental types described in the previous section, there are several variants. This results from the multiplicity of quantities that can be chosen to describe the composition of the two phases. Typical choices for the aqueous phase are molar concentration (c_a), molality (b), and amount fraction (x). For the gas phase, molar concentration (c_g) and partial pressure (p) are often used. Note, however, that it is not possible to use the gas-phase amount fraction (y). At a given gas-phase amount fraction, the aqueous-phase concentration c_a depends on the total pressure and thus the ratio y/c_a is not a constant.

There are numerous combinations of these quantities. The eight variants recommended by IUPAC are summarized in Table 1. Numerical values of conversion factors between them are shown in Tables 2, 3, and 4.

2.3 Symbols

In the current literature, a plethora of different symbols is used for Henry’s law constants. Several symbols are used for the same variant, and sometimes the same symbol is used for different variants. However, for this work a consistent terminology is indispensable. Here, the IUPAC recommendations by Sander et al. (2022) are used: For Henry’s law solubility constants, the symbol H_s is used, and for Henry’s law volatility constants the symbol H_v is used.

To specify the exact variant of the Henry’s law constant, two superscripts are used. They refer to the numerator and the denominator of the definition. For example, H_s^{cp} refers to the Henry solubility defined as c/p . If H_s refers to the reference temperature $T^\ominus = 298.15 \text{ K}$, it will be denoted as H_s^\ominus . A summary of the symbols is shown in Table 5.

2.4 Temperature dependence of Henry’s law constants

In spite of the name Henry’s law ‘‘constant’’, it should be kept in mind that its value still depends on some parameters, e.g., the temperature T . The temperature dependence of equilibrium constants can be described with the van’t Hoff equation, which also applies to Henry’s law:

$$\frac{d \ln H_s}{d(1/T)} = \frac{-\Delta_{\text{sol}}H}{R}, \quad (1)$$

where $\Delta_{\text{sol}}H$ = enthalpy of dissolution and R = gas constant. Note that the letter H in the symbol $\Delta_{\text{sol}}H$ refers to enthalpy and is not related to the letter H for Henry’s law constants. Integrating the above equation leads to

$$\ln H_s = \frac{-\Delta_{\text{sol}}H}{R} \frac{1}{T} + \text{const} \quad (2)$$

Calling the constant of integration A , and defining the parameter $B = -\Delta_{\text{sol}}H/R$, we get:

$$\ln H_s = A + \frac{B}{T} \quad (3)$$

or

$$H_s = \exp(A) \times \exp\left(\frac{B}{T}\right) \quad (4)$$

To determine the parameters A and B experimentally, Henry's law constants are measured at several temperatures, and the method of least squares is used to fit the points to a function. Note that functions (3) and (4) produce slightly different fit parameters because the logarithmic function (3) puts less weight on errors of large Henry's law constants than the linear function (4) does. In this work, linear regression is performed using Eq. (3).

Thermodynamic data are often available at the temperature $T^\ominus = 298.15$ K. To present Henry's law constants at T^\ominus and also show their temperature dependence, an alternative form of Eq. (4) can be used:

$$H_s = H_s^\ominus \times \exp\left(B\left(\frac{1}{T} - \frac{1}{T^\ominus}\right)\right). \quad (5)$$

where $H_s^\ominus = \exp(A) \times \exp(B/T^\ominus)$. The enthalpy of dissolution $\Delta_{\text{sol}}H$ is independent of temperature here:

$$\frac{-\Delta_{\text{sol}}H}{R} = \frac{d \ln H_s}{d(1/T)} = B \quad (6)$$

In this work, the values H_s^\ominus and $d \ln H_s / d(1/T)$ are tabulated.

A simple equation based on the two parameters A and B is valid only for a limited temperature range, in which the

enthalpy of dissolution $\Delta_{\text{sol}}H$ can be considered constant. To accommodate a larger temperature range, a third parameter C is often added:

$$\ln H_s = A + \frac{B}{T} + C \times \ln T. \quad (7)$$

Here, the fit parameters A and B are different from those calculated for function (3). The enthalpy of dissolution $\Delta_{\text{sol}}H$ changes linearly with temperature in the 3-parameter fit:

$$\frac{-\Delta_{\text{sol}}H}{R} = \frac{d \ln H_s}{d(1/T)} = B - CT \quad (8)$$

To cover an even larger temperature range with an empirical formula, the dependence of $\ln H_s$ on T can be expressed as the sum of several terms. For example, Wilhelm et al. (1977) used the formula:

$$\ln H_s = A + B \times T^{-1} + C \times \ln T + D \times T. \quad (9)$$

The analytical derivative is simply the sum of the derivatives of the individual terms. Using the derivatives from Table 6, the temperature dependence of this expression can be calculated as:

$$\frac{d \ln H_s}{d(1/T)} = 0 + B - C \times T - D \times T^2. \quad (10)$$

When reporting Henry's law constants as such a function, it is important to present sufficient significant digits because H_s depends exponentially on the parameters.

Note that the temperature dependences for H_s^{cp} and H_s^{cc} are different since the conversion factor between them includes the temperature:

$$\begin{aligned} H_s^{\text{cp}} &= H_s^{\text{cc}}/(RT) \\ \Leftrightarrow \ln H_s^{\text{cp}} &= \ln H_s^{\text{cc}} + \ln(1/R) + \ln(1/T) \\ \Rightarrow \frac{d \ln H_s^{\text{cp}}}{d(1/T)} &= \frac{d \ln H_s^{\text{cc}}}{d(1/T)} + \frac{d \ln(1/T)}{d(1/T)} \\ &= \frac{d \ln H_s^{\text{cc}}}{d(1/T)} + T. \end{aligned} \quad (11)$$

2.5 Effective Henry's law solubility constants $H_{s,\text{eff}}$ 30

The Henry's law constants mentioned so far describe the equilibrium between a chemical species in the gas phase and exactly the same species in the aqueous phase. This type is called the "intrinsic" Henry's law constant.

Once transferred, some species react in the aqueous phase. If these chemical reactions are fast and result in irreversible destruction, Henry's law cannot be applied. If, however, the species enters a fast equilibrium in the aqueous-phase, it is possible to define an "effective" Henry's law constant $H_{s,\text{eff}}$, using a "total concentration" c_{tot} . Depending on the chemical class, there are different ways to define such a total concentration. 40

2.5.1 $H_{s,\text{eff}}$ for aldehydes

Aldehydes can be hydrated, forming geminal diols. For example, methanal (HCHO) is almost completely hydrated in aqueous solution: 45

The total concentration of dissolved methanal is:

$$c_{\text{tot}} = c(\text{HCHO}) + c(\text{H}_2\text{C}(\text{OH})_2) \quad (13)$$

The intrinsic Henry's law solubility constant of HCHO is: 50

$$H_s = \frac{c(\text{HCHO})}{p(\text{HCHO})} \quad (14)$$

In contrast, the effective Henry's law constant $H_{s,\text{eff}}$ is defined as:

$$H_{s,\text{eff}} = \frac{c_{\text{tot}}}{p(\text{HCHO})} = \frac{c(\text{HCHO}) + c(\text{H}_2\text{C}(\text{OH})_2)}{p(\text{HCHO})} \quad (15)$$

2.5.2 $H_{s,\text{eff}}$ for acids and bases 55

Acids and bases undergo ionic dissociation upon dissolution, e.g.:

Defining the total concentration c_{tot} as

$$c_{\text{tot}} = c(\text{HCl}) + c(\text{Cl}^-), \quad (17) \quad 60$$

the effective Henry's law constant is:

$$H_{s,\text{eff}} = \frac{c_{\text{tot}}}{p(\text{HCl})} = \frac{c(\text{HCl}) + c(\text{Cl}^-)}{p(\text{HCl})} \quad (18)$$

Considering the acidity constant

$$K_a = \frac{c(\text{H}^+)c(\text{Cl}^-)}{c(\text{HCl})}, \quad (19)$$

the relation between the intrinsic and the effective Henry's law constant for HCl can be written as:

$$H_{s,\text{eff}} = H_s \times \left(1 + \frac{K_a}{c(\text{H}^+)} \right) \quad (20)$$

Since the factor on the right-hand side contains $c(\text{H}^+)$, the conversion between the intrinsic and the effective Henry's law constant is pH-dependent. Thus, effective Henry's law constants of acids and bases are not material constants but depend on solution pH. Proportionality between $p(\text{HCl})$ and c_{tot} is restricted to conditions under which the uptake of gaseous HCl does not affect the acidity of the solution.

In order to obtain a pH-independent constant, the product of the intrinsic Henry's law constant H_s^{cp} and the acidity constant K_a is often used for HCl and other strong acids:

$$H'_s = H_s^{cp} \times K_a = \frac{c(\text{H}^+) \times c(\text{Cl}^-)}{p(\text{HCl})} \quad (21)$$

Although H'_s is usually also called a Henry's law constant, it should be noted that it is a different quantity and it has different units than H_s^{cp} .

2.5.3 $H_{s,\text{eff}}$ for halogens

In the aqueous phase, halogens are in equilibrium with their hypohalous acids, e.g.:

The equilibrium constant is:

$$K = \frac{c(\text{HOCl})c(\text{H}^+)c(\text{Cl}^-)}{c(\text{Cl}_2)} \quad (23)$$

Since the sum of Cl_2 and HOCl is not affected by this equilibrium, a "total chlorine concentration" c_{tot} can be defined as:

$$c_{\text{tot}} = c(\text{Cl}_2) + c(\text{HOCl}), \quad (24)$$

Using c_{tot} , it is formally possible to define an effective Henry's law constant as:

$$H_{s,\text{eff}} = \frac{c_{\text{tot}}}{p(\text{Cl}_2)} = \frac{c(\text{Cl}_2) + c(\text{HOCl})}{p(\text{Cl}_2)} \quad (25)$$

However, this definition is problematic because it doesn't work at infinite dilution. With decreasing Cl_2 concentration, the equilibrium in Eq. (22) will shift to the right (Le Chatelier's principle), i.e., $c(\text{HOCl}) \gg c(\text{Cl}_2)$, and the effective Henry's law solubility constant goes to infinity (see, e.g., Fig. 2 in Jones (1911) or Fig. A1 in Lin and Pehkonen (1998)). Therefore, the intrinsic Henry's law constant should be used for halogens, and the term "effective Henry's law constant" should be avoided here.

Instead of extrapolating to infinite dilution, the total chlorine solubility is sometimes reported at the fixed partial pressure of $p(\text{Cl}_2) = 101325$ Pa. However, even in the vicinity of 101325 Pa, the total chlorine concentration c_{tot} is not proportional to $p(\text{Cl}_2)$.

In order to convert experimentally determined chlorine solubilities to the intrinsic constant $H_s(\text{Cl}_2)$, additional processes may have to be considered, e.g., aqueous-phase diffusion (Brian et al., 1962; Leaist, 1986) and the formation of chlorine hydrates (Adams and Edmonds, 1937; Young, 1983).

2.6 Dependence of Henry's law constants on the composition of the solution

Values of Henry's law constants for aqueous solutions depend on the composition of the solution, i.e., on its ionic strength and on dissolved organics. In general, the solubility of a gas decreases with increasing salinity ("salting out"). However, a "salting in" effect has also been observed, e.g., for the effective Henry's law constant of glyoxal (Kampf et al., 2013; Kurtén et al., 2015). The effect can be described with the Sechenov equation (Setschenow, 1889). Note that the scientific transliteration from Cyrillic is "Sechenov" but the original article was written in German and used the German transliteration "Setschenow". There are many alternative ways to define the Sechenov equation, depending on how the aqueous-phase composition is described (based on concentration, molality, or amount fraction) and which variant of the Henry's law constant is used. Describing the solution in terms of molality is preferred because molality is invariant to temperature and to the addition of dry salt to the solution (see Sander (1999) for details). Thus, the Sechenov equation can be written as:

$$\log_{10} \left(\frac{H_{s0}^{bp}}{H_s^{bp}} \right) = K_s \times b(\text{salt}) \quad (26)$$

where H_{s0}^{bp} = Henry's law constant in pure water, H_s^{bp} = Henry's law constant in the salt solution, K_s = molality-based Sechenov parameter for a given salt, and $b(\text{salt})$ = molality of the salt. For mixed electrolyte solutions with more than one salt, an extension of the Sechenov equation developed by Schumpe (1993) and Weisenberger and Schumpe (1996) can be used. Sechenov parameters are not suitable for systems in which a species reacts irreversibly with the salt (e.g., $\text{N}_2\text{O}_5 + \text{Cl}^-$).

Since the atmosphere contains very dilute cloud droplets as well as highly concentrated aerosols, adequate values of Henry's law constants should be used. Unfortunately, Sechenov parameters are unknown for many species.

3 Values of Henry's law constants

3.1 The data compilation

The compilation of Henry's law constants is presented in the appendix, and it is also available online at <https://www.henrys-law.org>. It contains Henry's law constants for inorganic and organic species of potential importance in environmental chemistry. Most data were measured at ambient conditions (around 298 K and 1 atm). Data at high temperatures are excluded or (if possible) extrapolated to $T^\ominus = 298.15$ K. The data refer to aqueous solutions; octanol and other solvents are not considered. The constants refer to pure water as solvent unless noted otherwise (e.g., sea water).

All Henry's law constants have been converted to a uniform format: H_s^{cp} with the unit $\text{mol}/(\text{m}^3 \text{Pa})$. In cases where the conversion involves the temperature-dependent density of water, the parameterization by Bettin and Spieweck (1990) was used to calculate $\rho_{\text{H}_2\text{O}}$ at the temperature T . The temperature-dependent vapor pressure of water p_{sat} was calculated using the parameterization by Buck (1981).

Inorganic substances are sorted according to the elements they contain. The order chosen is: O, H, N, F, Cl, Br, I, S, rare gases, others. Compounds with several of these elements are put into the last of the applicable sections. For example, nitril chloride which contains O, N and Cl, is listed in the Cl section. Carbon-containing compounds (including CO and CO₂) are sorted somewhat arbitrarily by increasing chain length and complexity. Hetero atoms (O, N, F, Cl, Br, I, S, P, etc.) are sorted in the same order as for inorganic compounds. The table contains the following groups of species:

The first column of the table shows the systematic name, the chemical formula, trivial names (if any), the CAS registry number (in square brackets), and the InChIKey.

The column labeled " H_s^{cp} " contains Henry's law solubility constants at the reference temperature $T^\ominus = 298.15$ K. Values are rounded to two significant digits and given in the unit mol/(m³ Pa).

The column labeled " $d \ln H_s / d(1/T)$ " contains the temperature dependence of the Henry solubility as defined in Eq. (5), rounded to two significant digits and given in the unit K. If the term $\Delta_{sol}H$ is temperature-dependent, the value of $d \ln H_s / d(1/T)$ is calculated at $T^\ominus = 298.15$ K. If a 3-parameter fit according to Eq. (7) allows the parameterization over a larger temperature range, it is presented in the notes.

For each table entry the column labeled "type" denotes how the Henry's law constant was obtained in the given reference. Literature reviews are usually most reliable, followed by original publications of experimental determinations of H_s . Other data has to be treated more carefully. The types listed here are roughly ordered by decreasing reliability. Note, however, that recent measurements which are newer than the latest review article should always be considered.

"L" The cited paper is a *literature* review.

"M" Original publication of a *measured* value.

"V" *Vapor* pressure of the pure substance divided by aqueous solubility (sometimes called "VP/AS").

"R" The cited paper presents a *recalculation* of previously published material (e.g. extrapolation to a different temperature or concentration range).

"T" *Thermodynamical* calculation ($\Delta_{sol}G = -RT \ln H$, see Sander (1999) for details).

"X" The original paper was not available for this study. The data listed here were found in a secondary source.

"C" The paper is a *citation* of a reference which I could not obtain (personal communication, Ph.D. theses, grey literature).

"Q" The value was calculated using a "*quantitative* structure property relationship" (QSPR) or a similar theoretical method.

"E" The value is an *estimate*. Estimates are listed only if no reliable data are available. 50

"?" The cited paper doesn't clearly state how the value was obtained.

"W" The value is probably *wrong*. It is not listed in the table, in order to avoid spreading of erroneous data. More information can be found in the notes. 55

In some cases there might be good agreement between different authors. However, if the original work they refer to is not known one has to be careful when evaluating the reliability. It is possible that they were recalculating data from the same source. The similarity in that case would not be due to independent investigations. 60

The table entries in the pdf of this document are hyperlinked to endnotes with additional information. Symbols and acronyms used here refer to those in the original publications.

The CAS numbers in the tables are hyperlinked to the NIST Chemistry WebBook. 65

3.2 Further sources of information

3.2.1 Review articles

Several reviews about Henry's law have been published, starting with Markham and Kobe (1941), up to more recent publications such as Wilhelm et al. (1977), Mackay and Shiu (1981), Staudinger and Roberts (1996), Staudinger and Roberts (2001), Fogg and Sangster (2003), and Burkholder et al. (2019). Practical guidance on the use of Henry's law has been published by Smith and Harvey (2007). 70

Experimental methods to obtain Henry's law constants as well as indirect (theoretical) methods have been described and compared by several authors. Only a brief summary of some articles is given here. For details, the reader is referred to the original publications: 75

- Battino and Clever (1966): Miscellaneous methods, partially of historical interest
- Betterton (1992): Head-space method, bubble column method, thermodynamic cycles, calculation from vapor pressure and solubility, linear correlations 85
- Turner et al. (1996): Static methods, mechanical recirculation methods, separate measurement of solubility and pure species vapor pressure, ebulliometry, perturbation chromatography
- Staudinger and Roberts (1996): Batch air stripping, concurrent flow technique, Equilibrium Partitioning in Closed Systems (EPICS), calculation via Quantitative Property Property Relationships (QPPR), Quantitative Structure Property Relationships (QSPR), UNiversal quasichemical Functional group Activity Coefficients (UNIFAC) 90

- Brennan et al. (1998): Comparison of predictive methods
- Sander (1999): QPPR, QSPR, thermodynamic calculations
- 5 – Fogg and Sangster (2003): Miscellaneous methods
- Dupeux et al. (2022): QSPR

3.2.2 Internet

On the internet, several pages provide Henry's law constants, e.g.:

- The Generator for Explicit Chemistry and Kinetics of Organics in the Atmosphere (GECKO-A) provides Henry's law constants on the basis of experimental data and structure-activity relationships:
20 http://geckoa.lisa.u-pec.fr/generateur_form.php
- The Pesticide Properties Database (PPD):
<https://www.ars.usda.gov/Services/docs.htm?docid=14199>
- HENRYWIN, a program to calculate Henry's law constants:
25 <https://www.epa.gov/tsca-screening-tools/epi-suitetm-estimation-program-interface>
- Vapor-liquid equilibrium data (mostly at elevated temperatures) from the "Dortmund Data Bank":

3.2.3 Vapor-liquid equilibrium data

35 Henry's law constants can be obtained from vapor-liquid equilibrium (VLE) data. For example, consider a binary mixture that consists of a solute dissolved in water. The total pressure p_{tot} over the solution is the sum of the partial pressures of the components. The partial pressure of the solute
40 can be defined via Henry's law, and the partial pressure of the water can be defined via Raoult's law:

$$\begin{aligned}
 p_{\text{tot}} &= p_{\text{solute}} + p_{\text{water}} \\
 &= xH_{\text{v}}^{px} + (1-x)p_{\text{sat}} \\
 &= x(H_{\text{v}}^{px} - p_{\text{sat}}) + p_{\text{sat}}
 \end{aligned}
 \quad (27)$$

where p_{sat} is the saturation vapor pressure of water. If VLE 45 data with the total pressure at several small solute fractions x are available, the derivative dp_{tot}/dx (i.e., the slope of a plot p_{tot} vs x) can be used to obtain the Henry's law constant:

$$\frac{dp_{\text{tot}}}{dx} = H_{\text{v}}^{px} - p_{\text{sat}} \Rightarrow H_{\text{v}}^{px} = \frac{dp_{\text{tot}}}{dx} + p_{\text{sat}} \quad (28)$$

4 The electronic supplement

50

The Supplement contains several files with additional information about the compiled Henry's law constants. It includes a README file with a detailed description. Here, only a short summary is given:

- The files `henry_*.f90` contain the Fortran 90 code 55 that was used to convert the values from the original publications to the uniform format H_{s}^{cp} with the unit $\text{mol}/(\text{m}^3 \text{Pa})$. The code and the comments in the code can be used to double-check that the conversion was done correctly. 60
- If the original publications contain measurements at different temperatures, the code often contains all individual data points, not just the regression line that was used to calculate the temperature dependence. In addition, the supplement contains data files 65 with the temperature-dependent values of H_{s}^{cp} in `output/Tdep_data/*.dat` and plots of the data points as well as the regression lines according to Eqs. (5) and (7) in `output/gnuplot/Tdep.pdf`.
- If the Henry's law constants are needed in electronic 70 form, it is cumbersome to extract them from the pdf of this article. Therefore, the supplement contains the files `output/*.f90` with declarations of the Henry's law constants (H_{s}^{cp} , H_{s}^{xp} , H_{s}^{bp} , H_{s}^{cc} , H_{v}^{pc} , H_{v}^{px} , and H_{v}^{cc}) in Fortran 90 syntax. 75
- For some references, the `util/` directory contains python scripts that preprocess input and perform other calculations related to the original data.

5 Summary and outlook

An updated and extended version of a compilation of Henry's 80 law constants has been presented. The collection, which is also available at <https://www.henrys-law.org>, will be continuously maintained, updated and extended in the future. If necessary, errata will be posted on the web page. In addition to providing a source of information, I hope that this 85 work will help to identify gaps in our current knowledge and stimulate research projects. In particular, it seems that even for some well-known chemicals like isoprene, HCl, Br₂, or BrCl, there is a large uncertainty in the value of the Henry's law constants. I always welcome emails informing me about 90

new measurements of Henry's law constants to be included in the table.

Appendix: Notes

- 1) A detailed temperature dependence with more than one parameter is available in the original publication. Here, only the temperature dependence at 298.15 K according to the van 't Hoff equation is presented.
- 2) Clever et al. (2014) recommend the data from Rettich et al. (2000).
- 3) Vapor pressure data for water from Wagner and Pruss (1993) was needed to calculate H_s .
- 4) The data from Millero et al. (2002a) were fitted to the 3-parameter equation: $H_s^{cp} = \exp(-130.91491 + 6700.12242/T + 17.04684 \ln(T))$ mol/(m³ Pa) with T in K.
- 5) Almost the same data were also published in Millero et al. (2002b).
- 6) The data from Millero et al. (2002b) were fitted to the 3-parameter equation: $H_s^{cp} = \exp(-118.73105 + 6163.97787/T + 15.22401 \ln(T))$ mol/(m³ Pa) with T in K.
- 7) Almost the same data were also published in Millero et al. (2002a).
- 8) The data from Rettich et al. (2000) were fitted to the 3-parameter equation: $H_s^{cp} = \exp(-179.13831 + 8707.17767/T + 24.33473 \ln(T))$ mol/(m³ Pa) with T in K.
- 9) The data from Sherwood et al. (1991) were fitted to the 3-parameter equation: $H_s^{cp} = \exp(-197.67462 + 9515.09306/T + 27.11204 \ln(T))$ mol/(m³ Pa) with T in K.
- 10) The data from Rettich et al. (1981) were fitted to the 3-parameter equation: $H_s^{cp} = \exp(-178.21340 + 8672.23354/T + 24.19307 \ln(T))$ mol/(m³ Pa) with T in K.
- 11) Measured at high temperature and extrapolated to $T^\ominus = 298.15$ K.
- 12) Value at $T = 293$ K.
- 13) Value at $T = 273$ K.
- 14) Value at $T = 310$ K.
- 15) The data from Murray and Riley (1969) were fitted to the 3-parameter equation: $H_s^{cp} = \exp(-180.22078 + 8760.50130/T + 24.49289 \ln(T))$ mol/(m³ Pa) with T in K.
- 16) The data from Shoor et al. (1969) were fitted to the 3-parameter equation: $H_s^{cp} = \exp(-91.44799 + 4548.67245/T + 11.38821 \ln(T))$ mol/(m³ Pa) with T in K.
- 17) The data from Carpenter (1966) were fitted to the 3-parameter equation: $H_s^{cp} = \exp(-130.04464 + 6687.45227/T + 16.90114 \ln(T))$ mol/(m³ Pa) with T in K.
- 18) The data from Morrison and Billett (1952) were fitted to the 3-parameter equation: $H_s^{cp} = \exp(-167.89288 + 8254.02144/T + 22.62741 \ln(T))$ mol/(m³ Pa) with T in K.
- 19) The data from Winkler (1891b) were fitted to the 3-parameter equation: $H_s^{cp} = \exp(-155.30315 + 7638.78869/T + 20.77945 \ln(T))$ mol/(m³ Pa) with T in K.
- 20) Calculated using machine learning matrix completion methods (MCMs).
- 21) Several references are given in the list of Henry's law constants but not assigned to specific species.
- 22) The data from Dean and Lange (1999) were fitted to the 3-parameter equation: $H_s^{cp} = \exp(-161.84252 + 7966.66767/T + 21.73409 \ln(T))$ mol/(m³ Pa) with T in K.
- 23) The partial pressure of water vapor (needed to convert some Henry's law constants) was calculated using the formula given by Buck (1981). The quantities A and α from Dean and Lange (1999) were assumed to be identical.
- 24) Value at "room temperature".
- 25) Clever et al. (2014) recommend the data from Battino (1981).
- 26) Battino (1981) concludes that ozone aqueous chemistry needs further clarification. Data from Roth and Sullivan (1981) are recommended, in spite of limitations and assumptions of the data.
- 27) Roth and Sullivan (1981) found that H_s depends on the concentration of OH⁻.
- 28) Value at $T = 291$ K.
- 29) Value given here as quoted by Durham et al. (1981).
- 30) Lide and Frederikse (1995) present an unusually low value for the Henry solubility of ozone. They refer to Battino (1981) as the source but the quoted value cannot be found there.
- 31) Parker (1992) assume that the free energy of solvation of atomic hydrogen is equal to that of He because of a similar van der Waals radius.
- 32) Roduner and Bartels (1992) say that the free energy of solvation $\Delta G_{\text{sol}}^{\text{H}}$ (and therefore Henry's law constant) of atomic hydrogen is approximated well by that of molecular hydrogen. However, they apparently do not give a value for $\Delta G_{\text{sol}}^{\text{H}}$.
- 33) Fitting the temperature dependence $d \ln H / d(1/T)$ produced a low correlation coefficient ($r^2 < 0.9$). The data should be treated with caution.
- 34) Data digitized from Figs. 2 and 3. in Schmidt (1979).

- 35) The data from Gordon et al. (1977) were fitted to the 3-parameter equation: $H_s^{cp} = \exp(-158.95051 + 6959.76267/T + 21.73478 \ln(T))$ mol/(m³ Pa) with T in K.
- 5 36) The data from Crozier and Yamamoto (1974) were fitted to the 3-parameter equation: $H_s^{cp} = \exp(-129.44163 + 5676.58091/T + 17.31002 \ln(T))$ mol/(m³ Pa) with T in K.
- 37) The data presented for hydrogen in Tab. II of Shoor et al. (1969) appear to be incorrect and are not reproduced here.
- 10 38) Value at $T = 303$ K.
- 39) The data from Morrison and Billett (1952) were fitted to the 3-parameter equation: $H_s^{cp} = \exp(-94.36490 + 4110.23880/T + 12.07743 \ln(T))$ mol/(m³ Pa) with T in K.
- 15 40) The data from Braun (1900) were fitted to the 3-parameter equation: $H_s^{cp} = \exp(171.59451 - 6856.02728/T - 28.14739 \ln(T))$ mol/(m³ Pa) with T in K.
- 20 41) The data from Winkler (1891a) were fitted to the 3-parameter equation: $H_s^{cp} = \exp(-103.47250 + 4506.63123/T + 13.44160 \ln(T))$ mol/(m³ Pa) with T in K.
- 25 42) Fitting the temperature dependence $d \ln H / d(1/T)$ produced a very low correlation coefficient ($r^2 < 0.5$). The data should be treated with caution.
- 43) The paper by Bunsen (1855a) was written in German. English versions with the same data were published by Bunsen (1855b) and Bunsen (1855c).
- 30 44) The data from Dean and Lange (1999) were fitted to the 3-parameter equation: $H_s^{cp} = \exp(-98.78036 + 4298.15060/T + 12.74131 \ln(T))$ mol/(m³ Pa) with T in K.
- 35 45) Young (1981a) recommend the data from Muccitelli and Wen (1978).
- 46) The data from Muccitelli and Wen (1978) were fitted to the 3-parameter equation: $H_s^{cp} = \exp(-103.11330 + 4676.56978/T + 13.28348 \ln(T))$ mol/(m³ Pa) with T in K.
- 40 47) The free energy of solution was calculated based on electrochemical reduction potentials and related free energies.
- 48) Calculated from correlation between the polarizabilities and solubilities of stable gases. The temperature dependence is an estimate of the upper limit.
- 45 49) Jacob (1986) assumed the temperature dependence to be the same as for water.
- 50) In the abstract, Schwartz (1984) gives a range of 9.9 mol/(m³ Pa) $< H_s^{cp} < 3.0 \times 10^1$ mol/(m³ Pa). The mean value of this range (2.0×10^1 mol/(m³ Pa)) has been used by Lelieveld and Crutzen (1991), Pandis and Seinfeld (1989), and Jacob (1986).
- 51) The value of H_s^\ominus was taken from Schwartz (1984).
- 55 52) Erratum for page 264 of Fogg and Sangster (2003): The second value from their Ref. [10] refers to 291.15 K, not 281.15 K.
- 53) This value is a correction of the solubility published by Lind and Kok (1986).
- 60 54) This value was measured at low pH. It is superseded by a later publication of the same group (Lind and Kok, 1994).
- 55) Pandis and Seinfeld (1989) cite an incorrect value from Lind and Kok (1986), see erratum by Lind and Kok (1994).
- 65 56) The data from Rettich et al. (1984) were fitted to the 3-parameter equation: $H_s^{cp} = \exp(-187.67954 + 8903.42524/T + 25.60079 \ln(T))$ mol/(m³ Pa) with T in K.
- 70 57) The data from Murray et al. (1969) were fitted to the 3-parameter equation: $H_s^{cp} = \exp(-174.95275 + 8370.22025/T + 23.67878 \ln(T))$ mol/(m³ Pa) with T in K.
- 75 58) The data from Morrison and Billett (1952) were fitted to the 3-parameter equation: $H_s^{cp} = \exp(-193.68175 + 9249.63150/T + 26.45117 \ln(T))$ mol/(m³ Pa) with T in K.
- 59) Value at $T = 311$ K.
- 60) The data from Braun (1900) were fitted to the 3-parameter equation: $H_s^{cp} = \exp(291.66324 - 11637.66767/T - 46.44134 \ln(T))$ mol/(m³ Pa) with T in K.
- 80 61) The data from Winkler (1891b) were fitted to the 3-parameter equation: $H_s^{cp} = \exp(-164.15156 + 7906.86704/T + 22.05399 \ln(T))$ mol/(m³ Pa) with T in K.
- 85 62) The data from Dean and Lange (1999) were fitted to the 3-parameter equation: $H_s^{cp} = \exp(-163.64571 + 7887.30480/T + 21.97696 \ln(T))$ mol/(m³ Pa) with T in K.
- 90 63) Tsuji et al. (1990) provide effective Henry's law constants at several pH values. Here, only the value at pH 5.8 is shown for the (acidic) S-compounds, and the value at pH 8.6 for the alkaline N-compounds.
- 95 64) Value given here as quoted by Betterton (1992).
- 65) The data from Dean and Lange (1999) were fitted to the 3-parameter equation: $H_s^{cp} = \exp(206.08500 - 7165.18642/T - 32.18383 \ln(T))$ mol/(m³ Pa) with T in K.

- 104)** Pandis and Seinfeld (1989) refer to Schwartz (1984) as the source but it is probably from Schwartz and White (1981).
- 105)** The value is incorrect. See erratum by Brimblecombe and Clegg (1989).

106) Möller and Mauersberger (1992) assumed the solubility of HNO_4 to be comparable to that of HNO_3 .

107) $H'_s = 9.4 \times 10^1 \times \exp\left(7400 \text{ K} \left(\frac{1}{T} - \frac{1}{T^\ominus}\right)\right) \frac{\text{mol}^2}{\text{m}^6 \text{ Pa}}$

108) The data from Dean et al. (1973) were fitted to the 3-parameter equation: $H_s^{cp} = \exp(-164.52717 + 8214.77776/T + 21.97482 \ln(T)) \text{ mol}/(\text{m}^3 \text{ Pa})$ with T in K.

109) The data from Ashton et al. (1968) were fitted to the 3-parameter equation: $H_s^{cp} = \exp(-279.21972 + 13536.60588/T + 38.97386 \ln(T)) \text{ mol}/(\text{m}^3 \text{ Pa})$ with T in K.

110) The data from Dean et al. (1973) were fitted to the 3-parameter equation: $H_s^{cp} = \exp(-318.29953 + 15733.17858/T + 44.55320 \ln(T)) \text{ mol}/(\text{m}^3 \text{ Pa})$ with T in K.

111) The value presented here appears to be the total solubility of chlorine (i.e., the sum of Cl_2 and HOCl) at a partial pressure of $p(\text{Cl}_2) = 101325 \text{ Pa}$. This is different from Henry's law constant, which is defined at extrapolation to infinite dilution.

112) Young (1983) recommends values calculated from Table 1 of Adams and Edmonds (1937). Thus, the data refer to effective values that take into account the hydrolysis in the aqueous-phase:

$$H_{s,\text{eff}} = ([\text{Cl}_2] + [\text{HOCl}])/p(\text{Cl}_2)$$

In addition, the values apply to a partial pressure of $p(\text{Cl}_2) = 101325 \text{ Pa}$, and not to infinite dilution.

113) The same experimental data were also published by Whitney and Vivian (1941b).

114) The data from Yakovkin (1900) were fitted to the 3-parameter equation: $H_s^{cp} = \exp(-122.31264 + 7690.40834/T + 15.63947 \ln(T)) \text{ mol}/(\text{m}^3 \text{ Pa})$ with T in K.

115) Leaist (1986) converted the total solubility of chlorine in pure water from Adams and Edmonds (1937) to an intrinsic Henry's law constant.

116) Adams and Edmonds (1937) re-analyzed the data from Yakovkin (1900) and Arkadiev (1918), considering deviations from the perfect gas law. They calculated the total solubility of chlorine (i.e., the sum of Cl_2 and HOCl) at several partial pressures of Cl_2 . This is different from Henry's law constant, which is defined at extrapolation to infinite dilution.

117) Arkadiev (1918) re-analyzed the measurements of Yakovkin (1900). In addition to the data between 15°C and 83.4°C , he also analyzed the experimental results at 0°C and obtained a dimensionless Henry solubility of $H_s^{cc} = 4.115$ at that temperature.

118) The value of ΔH° listed in Table 2 of Bartlett and Margerum (1999) is incorrect. The correct value can be found in the text on page 3411.

119) Wilhelm et al. (1977) present a fitting function for Cl_2 based on four papers which are cited in the footnotes of Table I. However, Bunsen (1855b) and Bunsen (1855c) don't contain any data for Cl_2 , and the data from Whitney and Vivian (1941a) and Whitney and Vivian (1941b) are inconsistent with the fitting function.

120) Calculated from the free energy of solution by Schwarz and Dodson (1984).

121) $H'_s = 2.0 \times 10^7 \frac{\text{mol}^2}{\text{m}^6 \text{ Pa}}$

122) $H'_s = 2.0 \times 10^7 \times \exp\left(9000 \text{ K} \left(\frac{1}{T} - \frac{1}{T^\ominus}\right)\right) \frac{\text{mol}^2}{\text{m}^6 \text{ Pa}}$

123) $H'_s = 2.0 \times 10^7 \times \exp\left(9000 \text{ K} \left(\frac{1}{T} - \frac{1}{T^\ominus}\right)\right) \frac{\text{mol}^2}{\text{m}^6 \text{ Pa}}$

124) $H'_s = 2.0 \times 10^7 \times \exp\left(9000 \text{ K} \left(\frac{1}{T} - \frac{1}{T^\ominus}\right)\right) \frac{\text{mol}^2}{\text{m}^6 \text{ Pa}}$

125) The data from Dean and Lange (1999) were fitted to the 3-parameter equation: $H_s^{cp} = \exp(9.16427 + 45.13997/T - 1.92853 \ln(T)) \text{ mol}/(\text{m}^3 \text{ Pa})$ with T in K.

126) Pandis and Seinfeld (1989) refer to Marsh and McElroy (1985) as the source but the quoted value cannot be found there.

127) This value was extrapolated from data at $T = 215 \text{ K}$ and $T = 263 \text{ K}$.

128) Value at $\text{pH} = 6.5$.

129) Value at $T = 200 \text{ K}$.

130) Secoy and Cady (1941) measured the gas/aqueous equilibrium constant $p(\text{Cl}_2\text{O})/c(\text{HOCl})^2$ but not the intrinsic Henry's law constant of Cl_2O .

131) Ourisson and Kastner (1939) measured the gas/aqueous equilibrium constant $p(\text{Cl}_2\text{O})/c(\text{HOCl})^2$ but not the intrinsic Henry's law constant of Cl_2O .

132) The data from this work were fitted to the 3-parameter equation: $H_s^{cp} = \exp(1680.49677 - 69933.08019/T - 254.37188 \ln(T)) \text{ mol}/(\text{m}^3 \text{ Pa})$ with T in K.

133) The gas/aqueous equilibrium constant $p(\text{Cl}_2\text{O})/c(\text{HOCl})^2$ was combined with the temperature-dependent aqueous-phase hydration constant $c(\text{HOCl})^2/c(\text{Cl}_2\text{O})$ from Roth (1929) in order to calculate the intrinsic Henry's law constant of Cl_2O .

134) Data for the equilibrium between gaseous Cl_2O and aqueous HOCl were taken from Secoy and Cady (1941).

- 135)** Data for the equilibrium between gaseous Cl_2O and aqueous HOCl were taken from Ourisson and Kastner (1939).
- 136)** Value at $T = 277$ K.
- 137)** The recommended value from Wilhelm et al. (1977) appears to be dubious as it refers to Secoy and Cady (1941) who do not provide a value for the intrinsic Henry's law constant of Cl_2O .
- 138)** Young (1983) cites data from Secoy and Cady (1941). However, that paper only describes the equilibrium between gas-phase Cl_2O and aqueous-phase HOCl . A Henry's law constant of Cl_2O is not provided. In addition, the values given by Young (1983) are not extrapolated to infinite dilution but to 1 atm partial pressure of Cl_2O . It is not explained how the nonlinear pressure dependence was extrapolated to 1 atm.
- 139)** Wilhelm et al. (1977) cite Secoy and Cady (1941) as the source for their value. However, that paper only describes the equilibrium between gas-phase Cl_2O and aqueous-phase HOCl . A Henry's law constant of Cl_2O is not provided.
- 140)** Even though Haller and Northgraves (1955) have been cited several times as the source of the ClO_2 solubility data, they did not perform any measurements. They took the data from the 1952 edition of the Kirk-Othmer Encyclopedia of Chemical Technology which apparently reproduced data from Holst (1944).
- 141)** Derived as a fitting parameter used in numerical modeling.
- 142)** Robinson et al. (1997) assumed that the entropy of vaporization is the same for HOCl and ClNO_3 according to Trouton's rule. On their page 3592, they mention a value of 7 M/atm at 250 K. However, checking their Fig. 9 and applying the temperature-dependence equation from their Tab. 3, it seems that the value of 7 M/atm refers to 298 K, not 250 K.
- 143)** Dubik et al. (1987) measured the solubility in concentrated salt solutions (natural brines).
- 144)** Value given here as quoted by McCoy et al. (1990).
- 145)** The data from Dean and Lange (1999) were fitted to the 3-parameter equation: $H_s^{cp} = \exp(-148.75612 + 9709.79389/T + 19.53402 \ln(T))$ mol/(m^3 Pa) with T in K.

- 450)** Value for the temperature range from 261 K to 281 K.
- 451)** Value at $T = 278$ K.
- 452)** Leriche et al. (2000) assume

$$H_s(\text{ROO}) = H_s(\text{ROOH}) \times H_s(\text{HO}_2)/H_s(\text{H}_2\text{O}_2).$$
- 453)** Lelieveld and Crutzen (1991) assume $H_s(\text{CH}_3\text{OO}) = H_s(\text{HO}_2)$.
- 454)** Jacob (1986) assumes $H_s(\text{CH}_3\text{OO}) = H_s(\text{CH}_3\text{OOH}) \times H_s(\text{HO}_2)/H_s(\text{H}_2\text{O}_2)$.
- 455)** Calculated using EVAPORATION and AIOMFAC.
- 456)** Calculated using the GROMHE model.
- 457)** Effective value that takes into account the hydration of HCHO:

$$H_s = ([\text{HCHO}] + [\text{CH}_2(\text{OH})_2])/p(\text{HCHO})$$
- 458)** Data from Table 1 by Zhou and Mopper (1990) were used to redo the regression analysis. The data for acetone in their Table 2 are incorrect.
- 459)** Dong and Dasgupta (1986) found that the Henry's law constant for HCHO is not a true constant but increases with increasing concentration. Note that their expression does not converge asymptotically to a constant value at infinite dilution.
- 460)** Ledbury and Blair (1925) (and also Blair and Ledbury (1925)) measured the solubility of HCHO at very high concentrations around 5 to 15 M. Their value of H_s increases with HCHO concentration. Lelieveld and Crutzen (1991), Hough (1991), and Pandis and Seinfeld (1989) all use these solubility data but do not specify how they extrapolated to lower concentrations. Since the concentration range is far from typical values in atmospheric chemistry, the value is not reproduced here.
- 461)** Value given here as quoted by Möller and Mauersberger (1992).
- 462)** Effective value that takes into account the hydration of the aldehyde:

$$H_s = ([\text{RCHO}] + [\text{RCH}(\text{OH})_2])/p(\text{RCHO})$$
- 463)** The data from Wieland et al. (2015) were fitted to the 3-parameter equation: $H_s^{cp} = \exp(25.01220 + 3596.11696/T - 6.81730 \ln(T))$ mol/(m³ Pa) with T in K.
- 464)** Value given here as quoted by Bone et al. (1983).
- 465)** Value suitable for the conditions of a case study in Mexico City.
- 466)** Volkamer et al. (2009) found average effective Henry's law constants for CHOCHO in the range 1.6×10^6 mol/(m³ Pa) $< H_s^{cp} < 5.9 \times 10^6$ mol/(m³ Pa) for solutions containing ammonium sulfate and/or fulvic acid. A salting-in effect by fulvic acid was observed even in the absence of sulfate.
- 467)** Solubility in sulfate aerosol.
- 468)** Woo and McNeill (2015) say that the Henry's law constant was updated based on advances in the literature since McNeill et al. (2012) but do not provide further details.
- 469)** Value at $T = 372$ K.
- 470)** The data from Wieland et al. (2015) were fitted to the 3-parameter equation: $H_s^{cp} = \exp(-176.35942 + 12895.73116/T + 22.70566 \ln(T))$ mol/(m³ Pa) with T in K.
- 471)** The formula of propenal is incorrectly given as "CH₂CHO" by Burkholder et al. (2019).
- 472)** The temperature dependence parameter C for 2-butenal is missing in Burkholder et al. (2019). The correct value is: C = 24.42 (R. E. Huie, pers. comm. 2021).
- 473)** The data from Buttery et al. (1971) for trans-2-octenal are incorrectly cited by Betterton (1992).
- 474)** Values at 298 K in Table C2 and C5 of Brockbank (2013) are inconsistent, with 6 % difference.
- 475)** Calculated under the assumption that ΔG and ΔH are based on [mol/l] and [atm] as the standard states.
- 476)** Calculated using the experimental value adjusted (EVA) method, see McFall et al. (2020) for details.
- 477)** Value at $T = 359$ K.
- 478)** Values at 298 K in Table C2 and C5 of Brockbank (2013) are inconsistent, with 5 % difference.
- 479)** Calculated from the slope of $y_{ac}P$ vs x_{ac} , using data from Tab. VIII in Lichtenbelt and Schram (1985).
- 480)** Value at $T = 313$ K.
- 481)** Values at 298 K in Table C2 and C5 of Brockbank (2013) are inconsistent, with 6 % difference.
- 482)** Values at 298 K in Table C2 and C5 of Brockbank (2013) are inconsistent, with 7 % difference.
- 483)** Values at 298 K in Table C2 and C5 of Brockbank (2013) are inconsistent, with 6 % difference.
- 484)** Table S2 in the supplement of Wu et al. (2022a) contains incorrect data for 3-octanone. Here, the corrected data (S. Wu, pers. comm. 2022) were used: 2.88E-2 and 1.52E-2 at 25 °C and 35 °C, respectively.
- 485)** Values at 298 K in Table C2 and C5 of Brockbank (2013) are inconsistent, with 7 % difference.
- 486)** The value listed as A for 2,6,8-trimethyl-4-nonanone is probably not A but the Henry's law volatility constant H_v^{px} at 298 K.
- 487)** The data from Wieland et al. (2015) were fitted to the 3-parameter equation: $H_s^{cp} = \exp(116.85779 - 1341.05519/T - 19.91967 \ln(T))$ mol/(m³ Pa) with T in K.

- 488)** The data from Wieland et al. (2015) were fitted to the 3-parameter equation: $H_s^{cp} = \exp(-74.84087 + 9452.88617/T + 7.41865 \ln(T))$ mol/(m³ Pa) with T in K.
- 489)** The value given here was measured at a liquid phase mixing ratio of 1 μmol/mol. Servant et al. (1991) found that the Henry's law constant changes at higher concentrations.
- 490)** Abraham (1984) smoothed the values from a plot of enthalpy against carbon number.
- 491)** The value of H_s^\ominus was taken from Keene and Galloway (1986).
- 492)** Calculated using thermodynamic data from Latimer (1952).
- 493)** Value at pH = 4.

- 497)** Value at $T = 289$ K.
- 498)** Value at $T = 338$ K.
- 499)** Pecsar and Martin (1966) is quoted as the source. However, only activity coefficients and no vapor pressures are listed there.
- 500)** The H298 and A,B,C data listed in Table 5-4 of Burkholder et al. (2019) are inconsistent, with 6 % difference.
- 501)** The formula of methyl ethanoate is incorrectly given as "CH₃C(O)CH₃" by Burkholder et al. (2015).
- 502)** The H298 and A,B data listed in Table 5-4 of Burkholder et al. (2015) are inconsistent, with 74 % difference.
- 503)** The same data were also published in Kieckbusch and King (1979a).
- 504)** The H298 and A,B,C data listed in Table 5-4 of Burkholder et al. (2019) are inconsistent, with 7 % difference.
- 505)** The formula of propyl ethanoate is incorrectly given as "CH₃C(O)C₃H₈" by Burkholder et al. (2019).
- 506)** Katritzky et al. (1998) list this species twice in their table, with different values. As it is unclear which of them is correct, the data are not reproduced here.
- 507)** Values at 298 K in Table C2 and C5 of Brockbank (2013) are inconsistent, with 5 % difference.
- 508)** Values at 298 K in Table C2 and C5 of Brockbank (2013) are inconsistent, with 6 % difference.
- 509)** The value listed as A for n-heptyl acetate is probably not A but the Henry's law volatility constant H_v^{px} at 298 K.
- 510)** The value listed as A for n-octyl acetate is probably not A but the Henry's law volatility constant H_v^{px} at 298 K.
- 511)** Betterton (1992) gives Kieckbusch and King (1979b) as the source. However, no data were found in that reference.
- 512)** Values at 298 K in Table C2 and C5 of Brockbank (2013) are inconsistent, with 6 % difference.
