

## Introduction

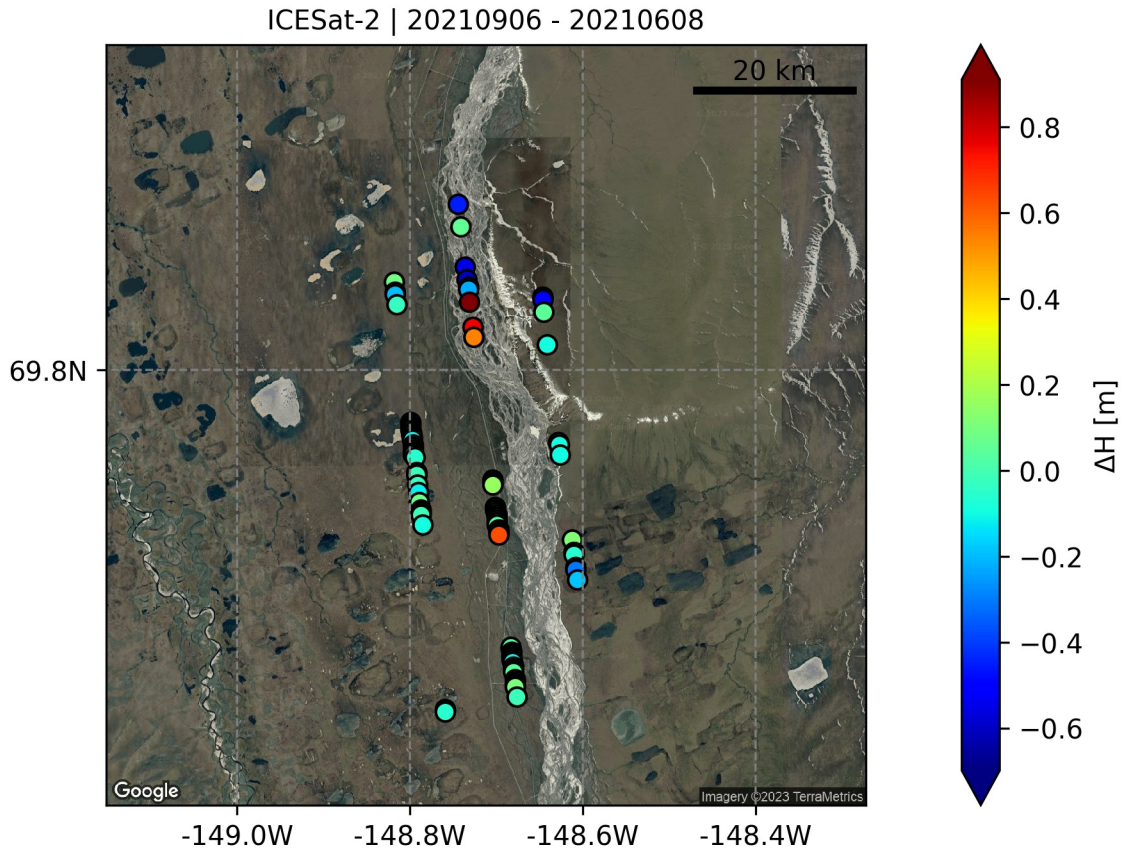

Supplement material includes information of used interferograms in this study (Table-S1), ICESat-2 height difference data in 2021 thaw season (Figure-S1), and the coherence maps for two compared sites, Beta (located in discontinuous permafrost zone) and U8 (located in continuous permafrost zone) (Figure-S2).

**Table-S1.** Information of interferograms used in this study.

**Figure-S1.** ICESat-2 ATL-08 best-fitted terrain height ('h\_te\_best\_fit') difference between two epochs: 2021-06-08 and 2021-09-06 for study area. Each circle represents height different between two epochs for 50 m grid cell. Read ICESat-2 data processing for details.

**Figure-S2.** Average spatial (a,c) and temporal (b,d) coherence for two sites: Top, Beta site southwest of Fairbanks, and bottom, CALM site U8. The triangles show the location of sites. The squares show the reference point selected for studies.
