

Supplement of

Distinctive aerosol-cloud-precipitation interactions in marine boundary layer clouds from the ACE-ENA and SOCRATES aircraft field campaigns

Xiaojian Zheng et al.

Correspondence: Xiquan Dong (xdong@arizona.edu)

Figure S1. Illustration of mixed layer determination of a) coupled MBL case, and b) decoupled MBL case. Solid lines denote vertical variations of liquid water potential temperature (θ_L , red) and total water mixing ratio (q_t , blue). Black dashed line denotes cloud boundaries and purple dashed line denotes mixed layer base altitude.

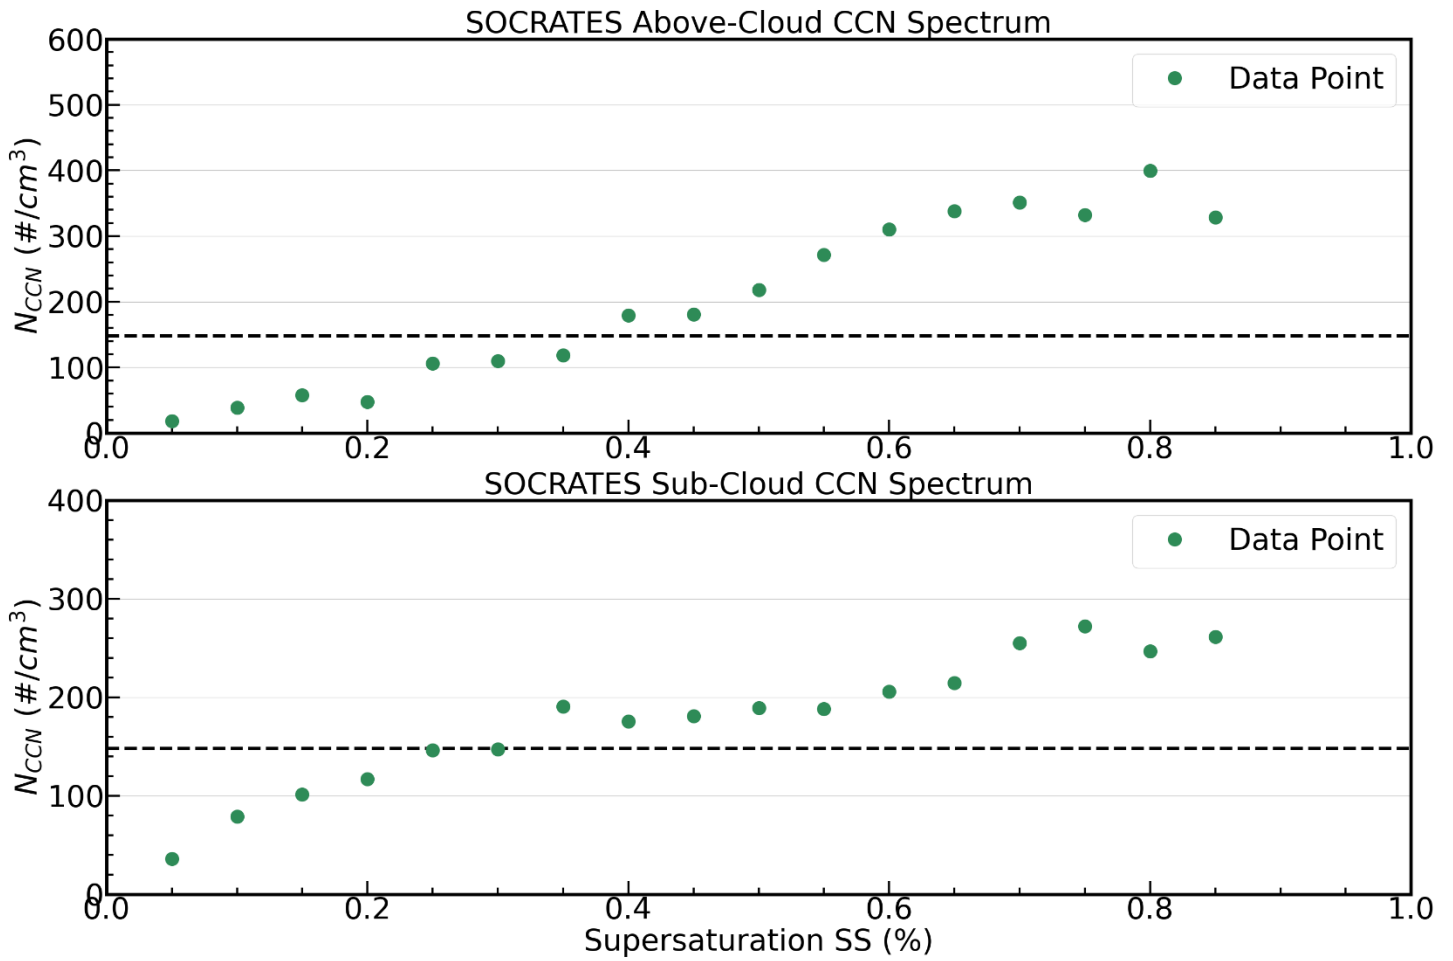

Figure S2. CCN spectra versus supersaturation during SOCRATES for a) above-cloud and b) sub-cloud regimes. Black dashed line denotes the averaged layer-mean N_c .

Figure S3. Coarse mode aerosol size distributions from PCASP ($D_p = 1\text{-}3.2 \mu\text{m}$) for a) above-cloud and b) sub-cloud regimes, during ACE-ENA summer (red) and winter (blue).

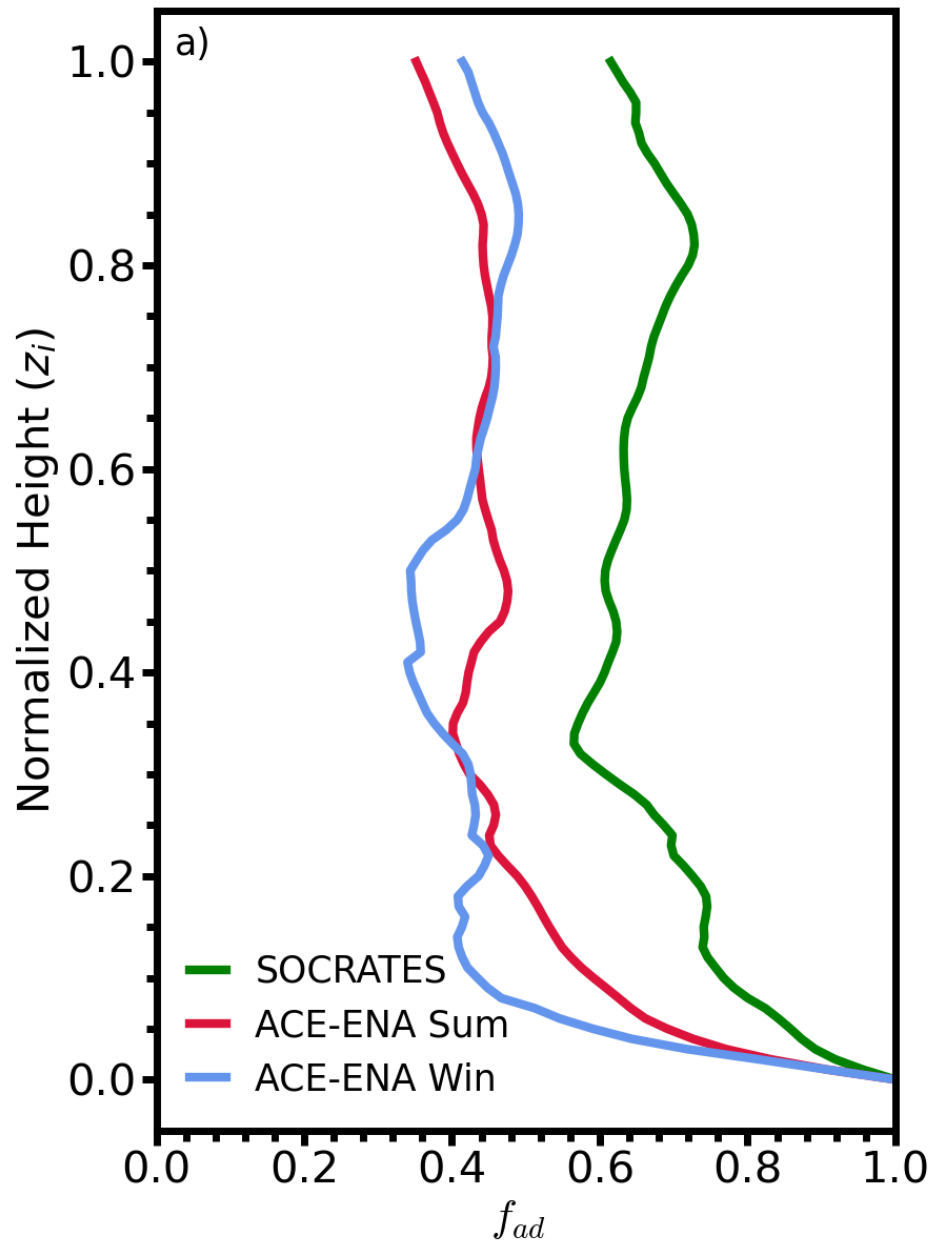

Figure S4. Vertical distributions of in-cloud sub-adiabaticity f_{ad} . ACE-ENA summer, winter and SOCRATES are color-coded with red, blue and green, respectively.

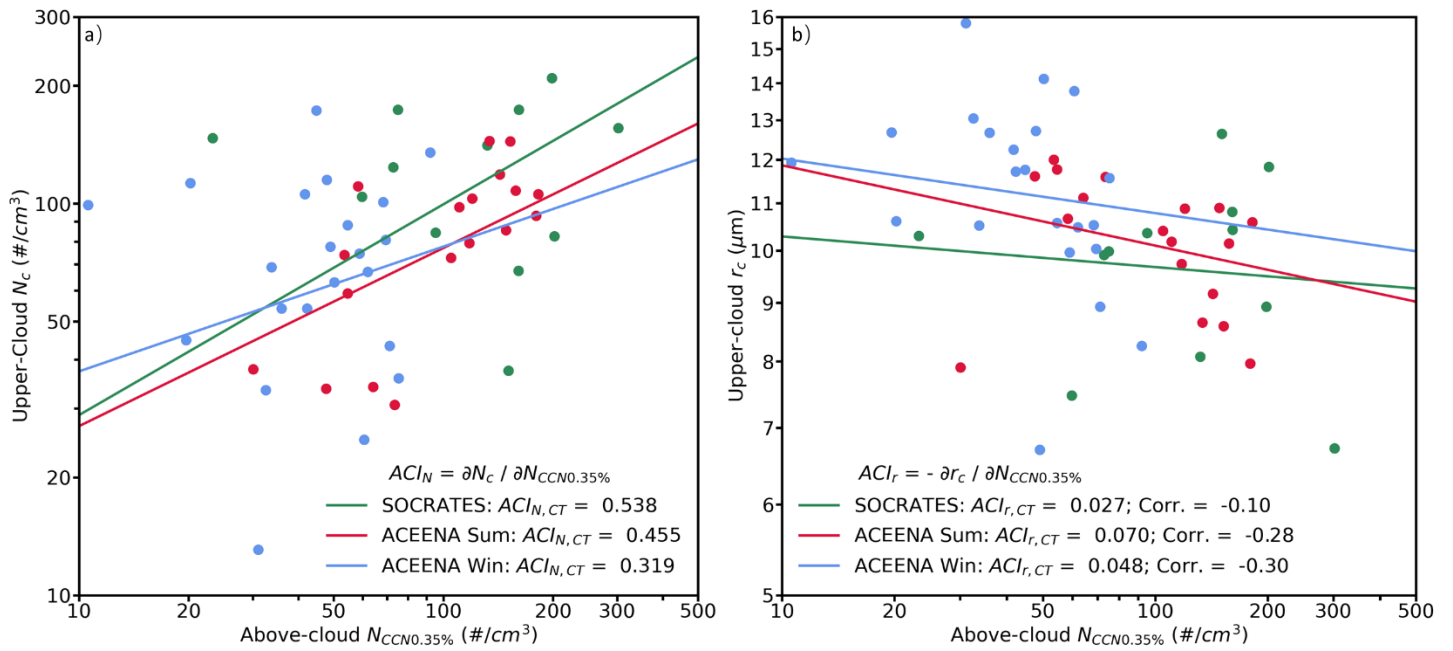

Figure S5. Scatterplots of a) upper-cloud N_c and b) r_c against the above-cloud $N_{CCN0.35\%}$. ACE-ENA summer, winter and SOCRATES are color-coded with red, blue and green, respectively.

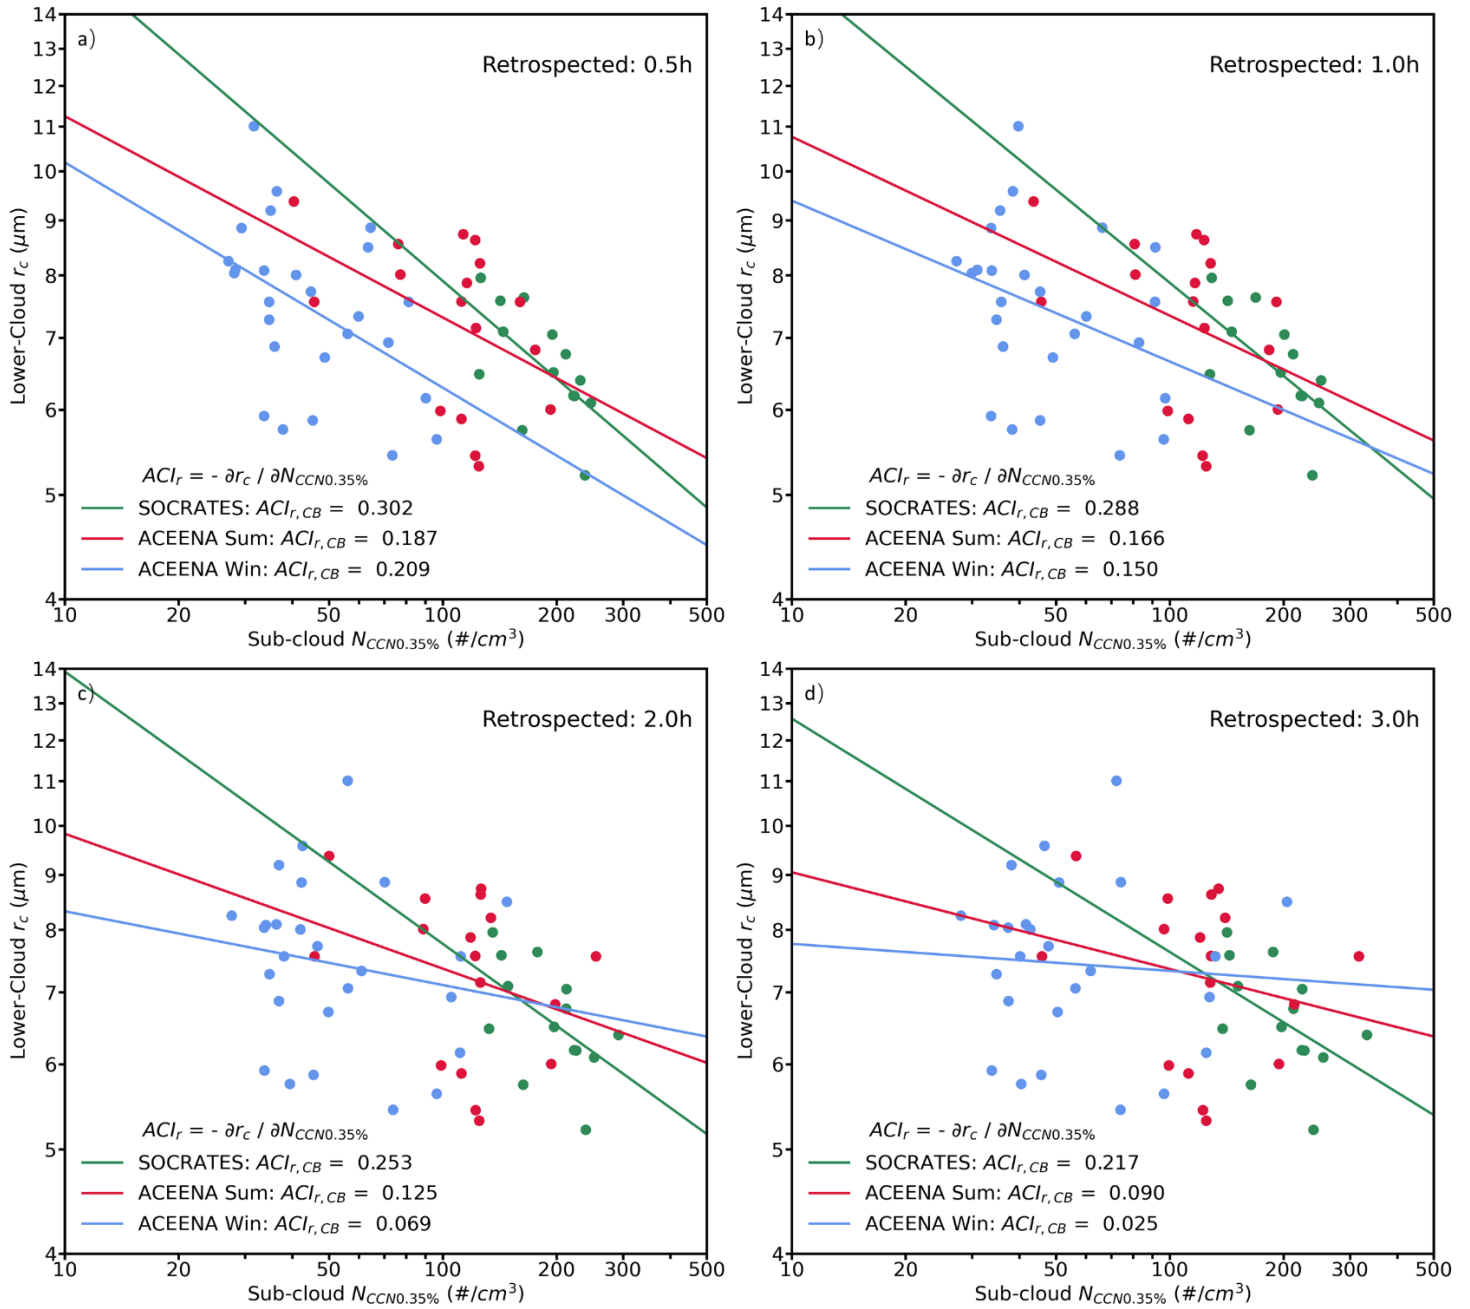

Figure S6. Scatterplots of lower-cloud r_c against the sub-cloud $N_{CCN0.35\%}$, at different $N_{CCN0.35\%}$ retrospective time of a) 0.5 hours, b) 1 hours, c) 2 hours and d) 3 hours.

Table S1. List of selected cloud profiles and associated macrophysics
