

Supplement to: The importance of diabatic processes for the dynamics of synoptic-scale extratropical weather systems – a review

Heini Wernli¹ and Suzanne L. Gray²

¹Institute for Atmospheric and Climate Science, ETH Zurich, Zurich, Switzerland

²Department of Meteorology, University of Reading, Reading, UK

The following pages contain figures for the four “catalyst cyclones” discussed in the paper. The figures are all produced with ERA5 reanalysis data and serve to illustrate the structure and evolution of the four cyclones with synoptic and PV maps, and vertical cross sections (at selected times). The four catalyst cyclones are:

- QE II storm 00 UTC on 09 September – 18 UTC on 12 September 1978
- President’s Day cyclone 00 UTC on 17 February – 18 UTC on 22 February 1979
- U.K. Great October storm 00 UTC on 13 October – 18 UTC on 18 October 1987
- Lothar 00 UTC on 23 December – 18 UTC on 28 December 1999

The following fields are shown for each cyclone at six-hourly intervals during the time periods indicated above:

- left panels: PV on 315 K (colours, in pvu) and MSLP (contours, every 4 hPa)
- middle panels: PV at 850 hPa (colours, in pvu) and MSLP (contours, every 4 hPa)
- right panels: potential temperature at 850 hPa (colours, in K), hourly accumulated precipitation (blue contours for 2 and 5 mm h⁻¹), and MSLP (contours, every 4 hPa)

In addition, meridional (left panels, from S to N) and zonal (right panels, from W to E) vertical cross-sections are shown through the centre of the cyclones at the time of minimum MSLP and at a few earlier times (as indicated specifically for each cyclone). Cross-sections show PV (colours, in PVU) and equivalent potential temperature (contours, every 3 K).

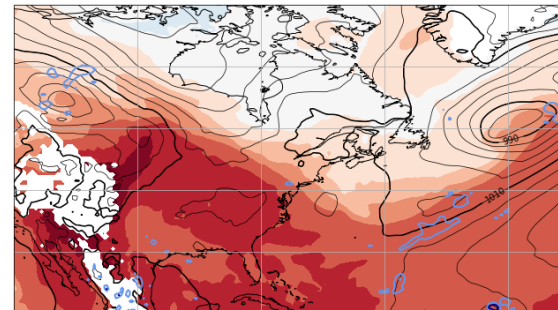

Acknowledgements: We are most grateful to Franziska Schnyder (ETH Zurich) for producing all figures shown in this Supplement.
