This PDF File includes
Supplementary Figures 1 to 3

Supplementary Figure 1: *G. bulloides*, *N. incompta* and *G. inflata* $\delta^{13}\text{C}$ records plotted together with the $\delta^{13}\text{C}_{\text{stack}}$ vs depth (cm).

Supplementary Figure 2: ^{13}C Suess effect estimates for Gardar Drift for the upper 200 m. The 0-200 m average ($\delta^{13}\text{C}_{\text{SE}_0-200}$) is marked with black bold line and is used to compare with the $\delta^{13}\text{C}_{\text{stack}}$ record.

Supplementary Figure 3: *G. bulloides* $\delta^{13}\text{C}$ vs $\delta^{13}\text{C}_{\text{SE}_50}$ comparison, plotted on the final age model (as in Figure 5b).
