

## Supplementary Information

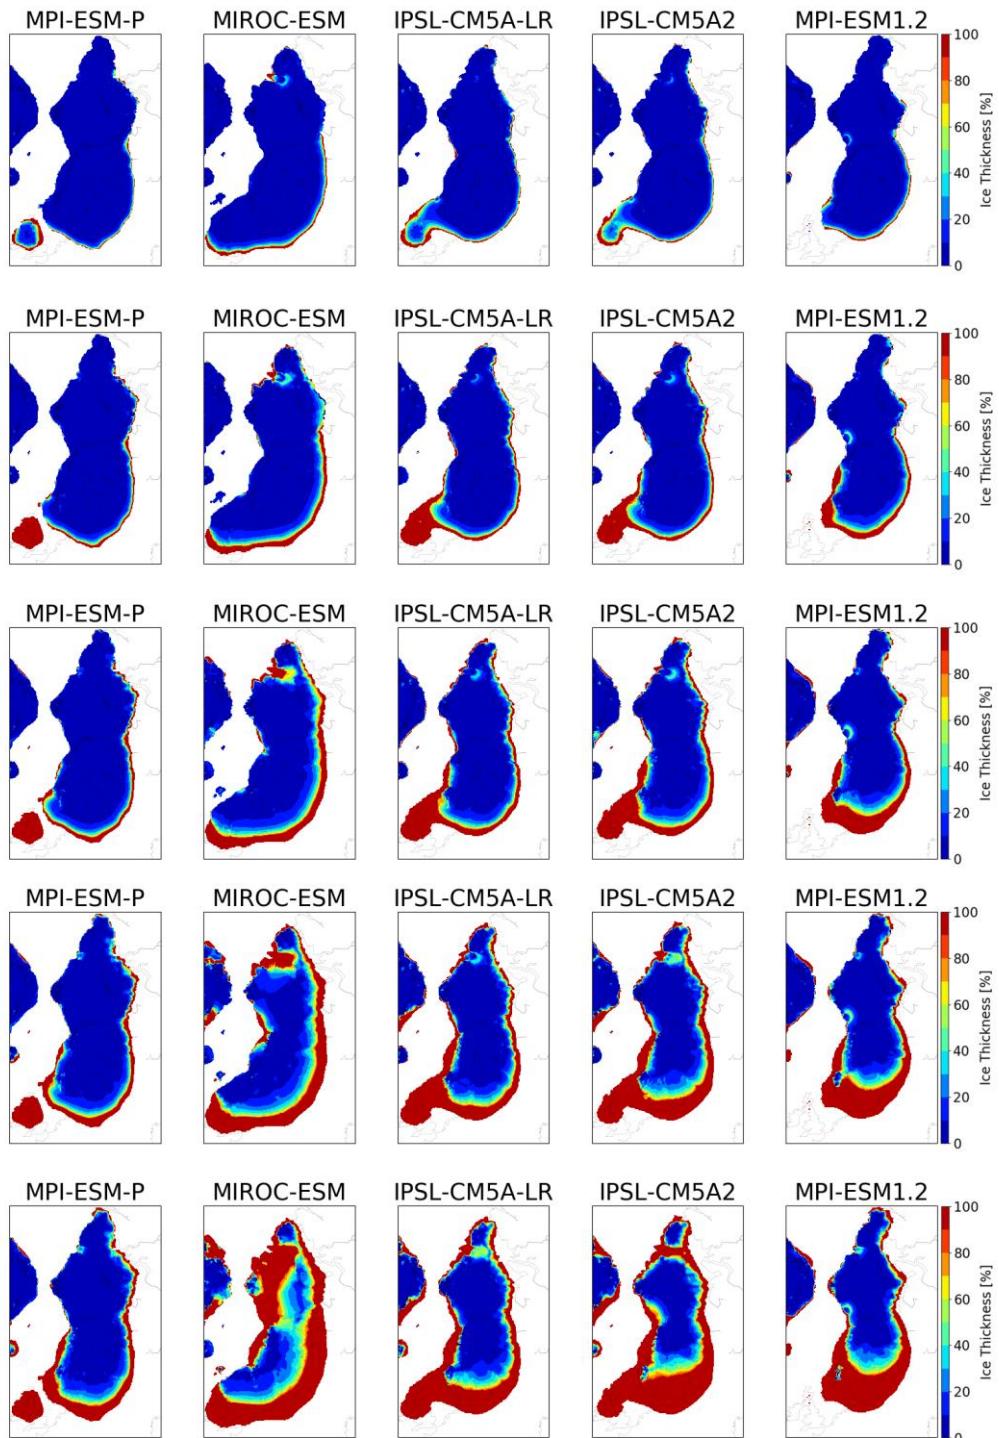

**Figure SP1:** Drainage basins used for the basal melting parameterization

19

20 **Figure SP2:** Surface mass balance calculated with each GCM forcing for 1°C (top) to 5°C (bottom) atmospheric  
 21 temperature perturbations.

22

23

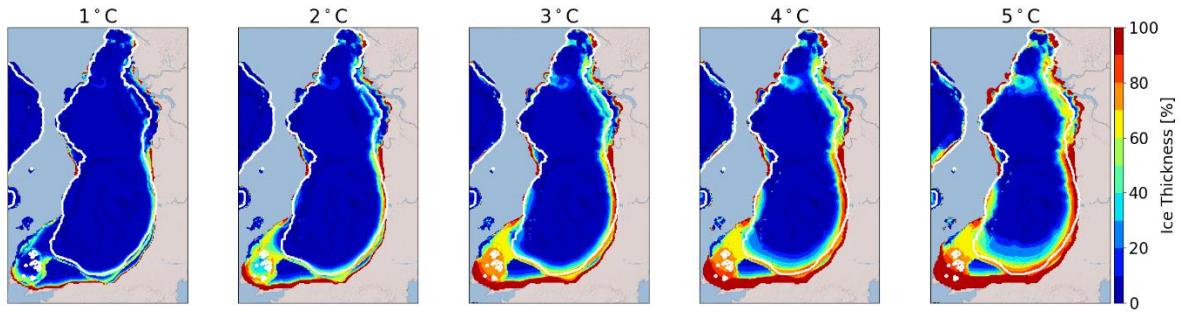

24 **Figure SP3:** Ice thickness lost obtained in the EXP1 experiments for each GCM forcing compared to the initial  
 25 LGM ice sheet for 1°C (top) to 5°C (bottom) atmospheric temperature perturbations.

43

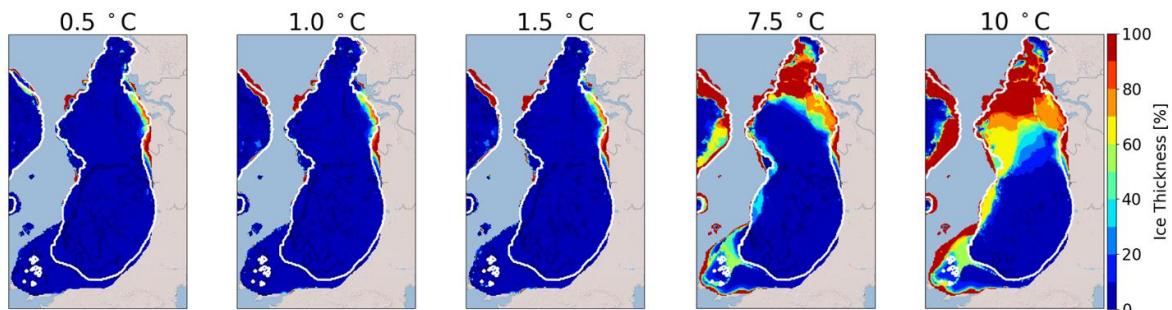

**Figure SP5:** Ice thickness lost after 1000 years (top) and 10000 years (bottom) compared to the initial ice sheet for a basal melting perturbation of  $K_t = 50 \text{ m } ^\circ\text{C}^{-1} \text{ yr}^{-1}$  for each GCM forcing. (Red 100% lost).

44  
45  
46

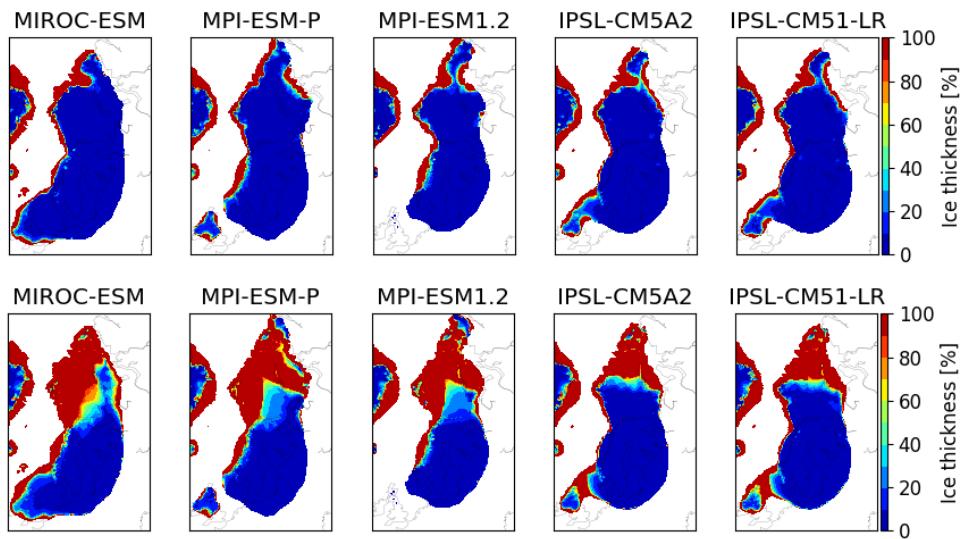

47  
48 **Figure SP6:** Average ocean temperature in the BJR (left) and SA sectors as a function of ocean depth.

49  
50

51  
52 **Figure SP7:** Multi-model mean of the ice thickness lost after 10000 years compared to the initial ice sheet for  
53 EXP3.2. (Red: 100% lost). For this experiment,  $K_t$  has been fixed to  $7 \text{ m } ^\circ\text{C}^{-1} \text{ yr}^{-1}$ . The white line represents the  
54 most credible extent derived from the DATED-1 compilation

55

56

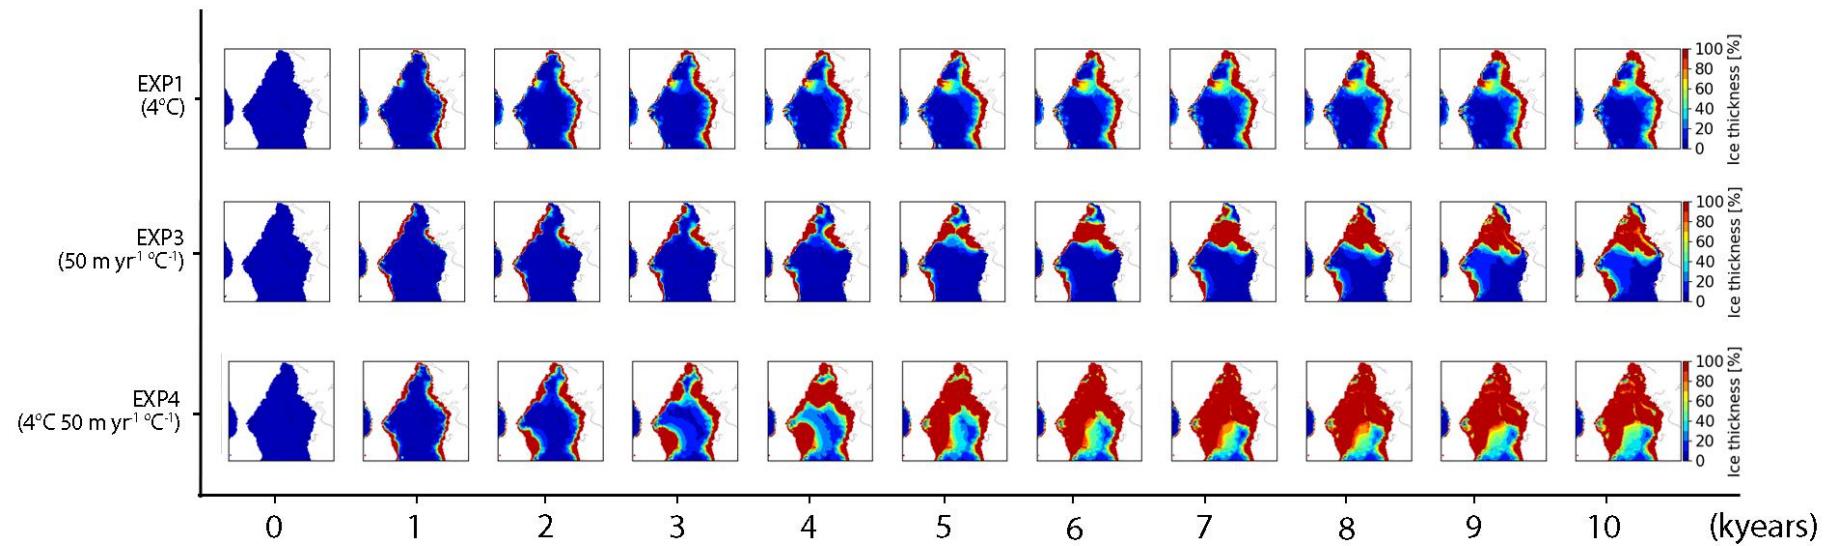

57 **Figure SP8:** Ice thickness lost after 1000 (top) and 10000 (bottom) model years compared to the initial LGM ice  
 58 sheet for an oceanic temperature perturbation of 10°C for each GCM forcing. (Red: 100% lost).

**Figure SP9:** top/ Ice thickness lost for simulation forced by MPI-ESM-P from 1000 to 10000 years with respect to the ice thickness of the LGM ice-sheet in the EXP1 (4°C) experiment Middle/ same as top/ for EXP3 (50 m  $\text{C}^{-1} \text{yr}^{-1}$ ). Bottom/ same as top for EXP4 (4°C and 50 m  $\text{C}^{-1} \text{yr}^{-1}$ ).

**Figure SP10:** Same as Figure SP9 for the simulation forced by MPI-ESM1.2

**Figure SP11:** Same as Figure SP9 for the simulation forced by MIROC-ESM.

**Figure SP12:** Ice thickness at the end of the 100,000-year LGM simulation (spin-up) for the different GCMs used as inputs to GRISLI. Basal melting is set to  $0.1 \text{ m yr}^{-1}$  as in Petrini et al., (2020). The white line is the most credible extent derived from the DATED-1 compilation and the orange areas are the simulated ice shelves.
