16 **Text S1. Selction of inputted HERM chemical species and its uncertainty calculation**

17 Considering the validity and credibility of monitoring data, chemical species including OA, NO₃⁻, SO₄²⁻, NH₄⁺,
18 Cl⁻, and BC were all selected to input HERM model for three pilot cities. For inorganic elements, Si, K, Ca, Cr, Mn,
19 Fe, Ni, Cu, Zn, As, Se, Ba, and Pb in Xi'an and Beijing, and Si, K, Ca, Ti, Cr, Mn, Fe, Ni, Cu, Zn, As, Se, Ba, and
20 Pb in Shijiazhuang were selected for source apportionment, respectively.

21 The uncertainty data of chemical species inputting HERM was calculated according to the recommendation in
22 the PMF5.0 user guideline. If the measured chemical species concentration is greater than the minimum detection
23 limit (MDL) provided, the uncertainty (Unc) calculation is based following equation:

$$24 \text{Unc}_i = \sqrt{(C_i \times E_i)^2 + (0.5 \times \text{MDL}_i)^2} \quad (1)$$

25 where C_i represents measured concertation for species i , E_i represents error fraction of species i . For online
26 measured data, the error fraction was recommended to use 10% (Rai et al., 2020). If the measured concentration is
27 less than or equal to the MDL provided, the Unc is calculated as the following equation:

$$28 \text{Unc} = \frac{5}{6} \times \text{MDL} \quad (2)$$

29

30 **Text S2 Diagnostics of HERM solutions**

31 In this study, factors numbering from two to ten were selected and run in the HERM software. Each factor
32 solution was run thirty times with completely unconstrained profiles to explore the possible sources. The optimal
33 factor number solution was determined by examining the ratio of Q and expected Q (Q_{exp}). The Q_{exp} in HERM was
34 equal to (samples × species – factors × (samples + species) + the number of constrained source profiles). As shown
35 in Fig. S5, the value of Q/Q_{exp} decreased with the increase of the factor number, which suggests increasing the factor
36 number could lead to a better explanation of the variance by HERM. However, the utility of increasing factors
37 declined with the number of factors. Too many factors could cause splitting profiles, although the Q/Q_{exp} may be
38 desirable (Liu et al., 2021; Salameh et al., 2018, 2016). Thus, the drops of Q/Q_{exp} ($\Delta Q/Q_{\text{exp}}$) were subsequently
39 evaluated to choose the optimal solution factor number. As shown in Table S2, when the number of factors increases
40 to more than six in Xi'an, the value of $\Delta Q/Q_{\text{exp}}$ shows a relatively stable change trend. A six-factor solution is
41 preferable because $\Delta Q/Q_{\text{exp}}$ between the five-solution and six-solution is smaller than that between the six-solution
42 and seven-solution (Liu et al., 2021). In addition, secondary nitrate plus sulfate and biomass burning were mixed
43 when the factor number was five, and vehicle emission was split into two profiles when the factor number was seven

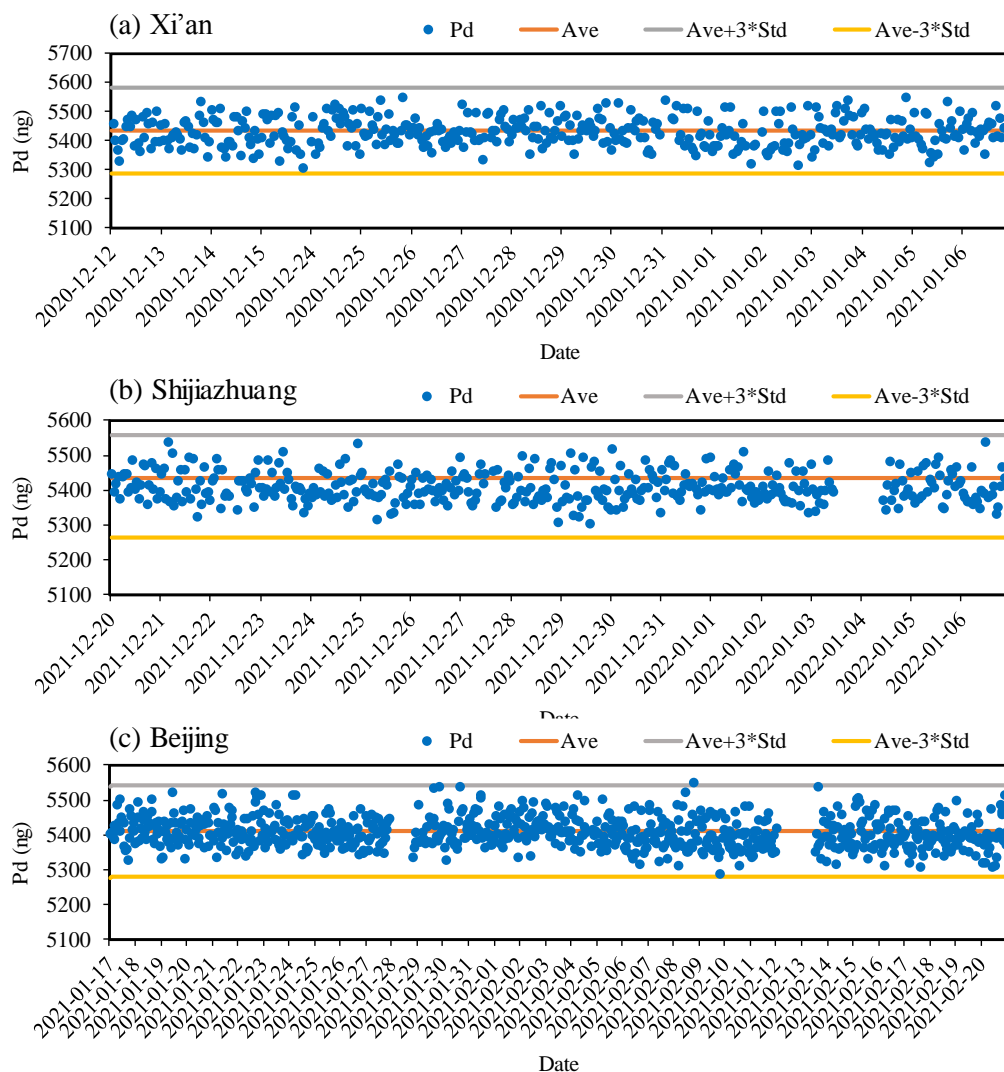

44 (Table S3). Therefore, the six-factor solution was determined as the optimal HERM solution for Xi'an. Similar
45 criterias were used for Shijiazhuang and Beijing, six-factor and eight-factor solutions were determined as optimal
46 HERM solutions, respectively.

47
 48 **Figure S1.** Annual average concentration of PM_{2.5} from 2013 to 2021 in Xi'an, Shijiazhuang, and Beijing. (The data
 49 are from the website of the local Ecological Environment Bureau, Xi'an: <http://xaepb.xa.gov.cn/>, Shijiazhuang:
 50 <https://sthjj.sjz.gov.cn/>, Beijing: <http://sthjj.beijing.gov.cn/>). The red dotted line represents the second level of the
 51 National Ambient Air Quality Standard (GB3095-2012, 35 µg m⁻³)
 52

53
 54 **Figure S2.** Correction of chemical components measured by Q-ACSM in different cities. During the campaigns,
 55 offline filter samples were simultaneously sampled for the correction. In summary, 29 offline samples in Xi'an, 83
 56 offline samples in Shijiazhuang, and 10 offline samples in Beijing were sampled respectively.

57

58 **Figure S3.** Concentration of the internal standard element (Pd) of Xact625 during sampling periods in (a) Xi'an,
 59 (b) Shijiazhuang, and (c) Beijing.

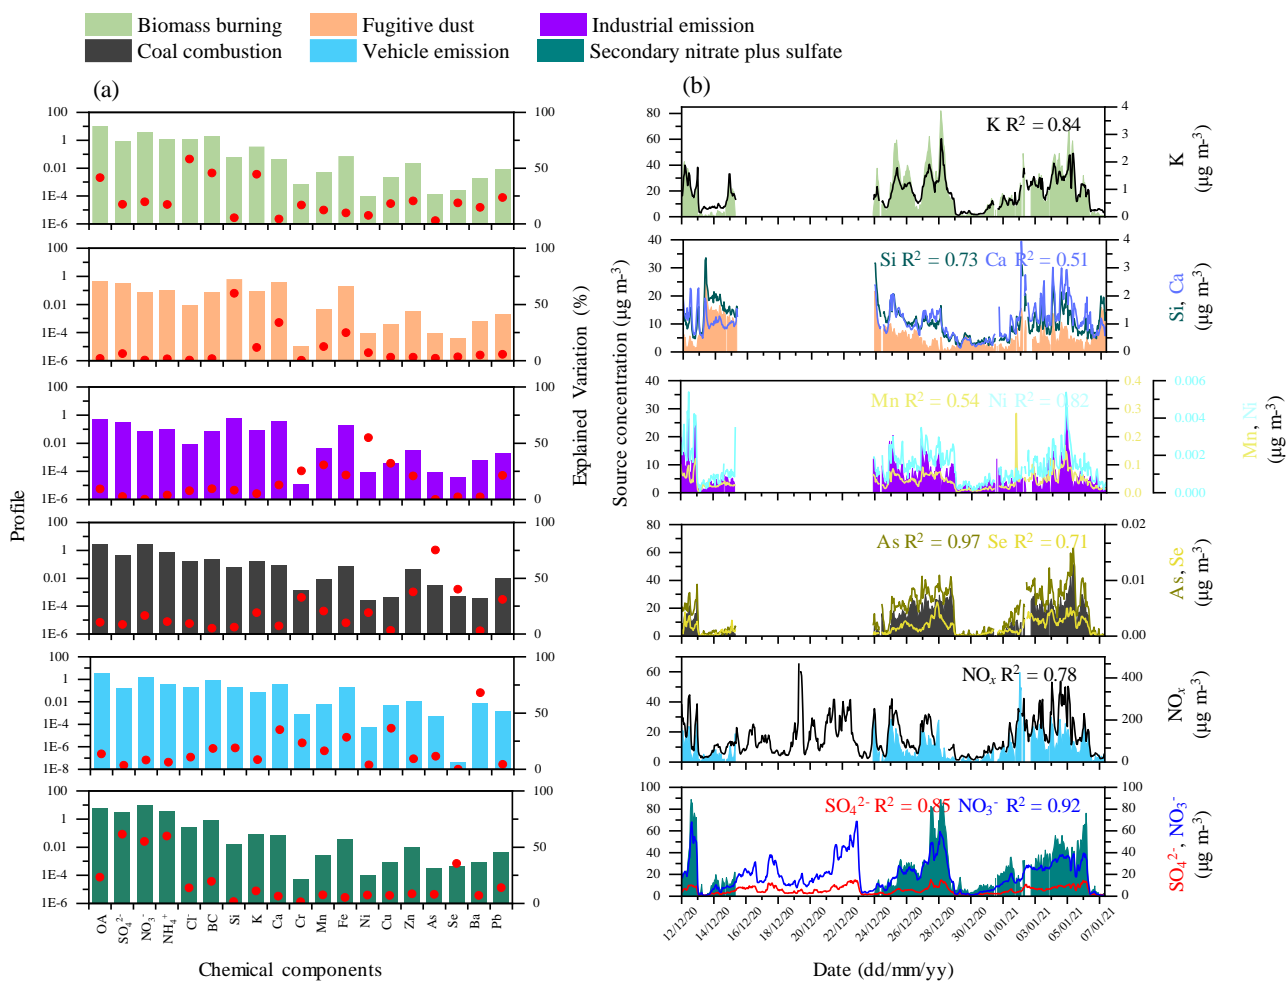

60

 114 (e, f), and source contribution (g, h) of PM_{2.5} during EP2 in Xi'an.

115 **Table S1.** Detailed information on complementary data for sampling sites

Sampling site	National Air Quality Monitoring Station	National Meteorological Station	complementary data
Xi'an	Gaoxinqiqu station, 1.1km from the sampling site	Haidian station, 7.6 km from the sampling site	hourly PM _{2.5} , NO _x , NO ₂ , CO, SO ₂ , O ₃ , WS, WD, T, RH
Shijiazhuang	Gaoxinqu station, 4.2 km from the sampling site	Shijiazhuang station, 23.8 km from the sampling site	hourly PM _{2.5} , NO ₂ , CO, SO ₂ , O ₃ , WS, WD, T, RH
Beijing	ChaoyangAotizhongxin station, 1.2 km from the sampling site	Jinghe station, 21.2 km from the sampling site	hourly PM _{2.5} , NO ₂ , CO, SO ₂ , O ₃ , WS, WD, T, RH

116 Note: WS: wind speed, WD: wind direction, T: temperature, RH: relative humidity.

117

118 **Table S2.** The $\Delta Q/Q_{\text{exp}}$ ^a value with increasing factor number from two to ten of the runs in Xi'an, Shijiazhuang, and
119 Beijing.

Parameter ^b	$\Delta Q/Q_{\text{exp}}$		
	Xi'an	Shijiazhuang	Beijing
F2-F3	1.3	1.8	5.7
F3-F4	0.9	2.2	2.3
F4-F5	1.1	1.2	1.9
F5-F6	0.4	0.3	1.5
F6-F7	0.3	0.3	1.5
F7-F8	0.2	0.2	0.3
F8-F9			0.4
F9-F10			0.3

120 ^a $\Delta Q/Q_{\text{exp}}$ means the difference of Q/Q_{exp} of two sequent factor numbers.

121 ^b Parameters represent the factor numbers (F) – (F+1).

122

123 **Table S3.** Sources diagnostics with increasing factor numbers from four to ten of the runs in Xi'an, Shijiazhuang,
 124 and Beijing.

Factor number	Sources identification		
	Xi'an	Shijiazhuang	Beijing
4	Secondary nitrate plus sulfate mixed with biomass burning and coal burning mixed with industrial emission	i) Secondary nitrate plus sulfate mixed with primary sources including biomass burning and coal combustion ii) Biomass burning, coal combustion, and vehicle emission was also mixed	i) Secondary sources mixed with primary sources including biomass burning, coal combustion, and vehicle emission ii) Biomass burning and coal combustion was mixed
5	Secondary nitrate plus sulfate mixed with biomass burning	Biomass burning, coal combustion, and vehicle emissions were mixed	Secondary sulfate mixed with coal combustion and industrial emission; secondary nitrate mixed with biomass burning
6	Six individual sources were identified	Six individual sources were identified	Secondary sulfate mixed with coal combustion and secondary nitrate mixed with industrial emission
7	Vehicle emission was split into two profiles Vehicle emission and industrial	Coal combustion was split into two profiles Vehicle emission and coal combustion	Secondary sulfate mixed with coal combustion
8	emission was split into two profiles, respectively.	were split into two profiles, respectively.	Eight individual sources were identified
9			Coal combustion was split into two profiles
10			Coal combustion and biomass burning were split into two profiles, respectively.

125

126 **Table S4.** Average concentrations of reconstructed PM_{2.5} and its chemical species in Xi'an, Shijiazhuang, and Beijing
 127 during the campaign* ($\mu\text{g m}^{-3}$)

Chemical Species	Xi'an	Shijiazhuang	Beijing
Reconstructed PM _{2.5}	77 ± 47	60 ± 39	64 ± 57
OA	25.9 ± 18.0	16.0 ± 9.7	22.1 ± 18.1
SO ₄ ²⁻	5.2 ± 3.4	7.0 ± 7.6	9.6 ± 11.3
NO ₃ ⁻	18.5 ± 14.5	15.8 ± 12.5	15.2 ± 16.7
NH ₄ ⁺	6.2 ± 4.5	7.0 ± 5.5	9.2 ± 10.3
Cl ⁻	1.9 ± 1.5	2.8 ± 2.2	0.7 ± 0.8
BC	4.5 ± 3.2	3.9 ± 2.5	1.9 ± 1.8
MD ^a	13.2 ± 7.0	6.0 ± 4.0	4.8 ± 3.8
TE ^b	1.1 ± 0.7	1.0 ± 0.6	0.9 ± 1.5

128 * Data during Xact625 failure shown in Figure S2 was excluded to calculate average concentration of campaign

129 ^a MD means mineral dust, which is equal to 2.20Al + 2.49Si + 1.63Ca + 2.42Fe + 1.94Ti

130 ^b TE means trace elements which is equal to K + Cr + Mn + Ni + Cu + Zn + As + Se + Ba + Pb

131

132 **Table S5.** The nitrogen oxidation ratio (NOR) and sulfur oxidation ratio (SOR) in Xi'an, Beijing, and Shijiazhuang
 133 during the campaigns^a

Parameters	Xi'an	Shijiazhuang	Beijing
NOR	0.15 ± 0.08	0.20 ± 0.11	0.16 ± 0.12
SOR	0.18 ± 0.08	0.36 ± 0.25	0.48 ± 0.23

134 ^a NOR = $n(\text{NO}_3^-)/(n(\text{NO}_3^-) + n(\text{NO}_2))$; SOR = $n(\text{SO}_4^{2-})/(n(\text{SO}_4^{2-}) + n(\text{SO}_2))$. where $n(\text{NO}_3^-)$, $n(\text{NO}_2)$, $n(\text{SO}_4^{2-})$, and $n(\text{SO}_2)$ are the molar
 135 concentrations of NO_3^- , NO_2 , SO_4^{2-} , and SO_2 , respectively.

136
