1 Ozone
Figure 1. Ozone mean horizontal distributions during boreal winter from the end of 1994 until 2017, for the products IAGOS-DM (left) and INCA-M (middle), and the biases (right) normalized with respect to the mean values between the two products. Each row displays a layer, with the non-separated UTLS at the top and the distinct LS and UT below.
Figure 2. As Fig. 1 for boreal spring.
Figure 3. As Fig. 1 for boreal summer.
2 Carbon monoxide
Figure 4. As Fig. 1 for boreal fall.
Figure 5. CO mean horizontal distributions during boreal winter from the end of 2001 until 2017, for the products IAGOS-DM (left) and INCA-M (middle), and the biases (right) normalized with respect to the mean values between the two products. Each row displays a layer, with the non-separated UTLS at the top and the distinct LS and UT below.
Figure 6. As Fig. 5 for boreal spring.
Figure 7. As Fig. 5 for boreal summer.
Figure 8. As Fig. 5 for boreal fall.
3 Reactive nitrogen
Figure 9. NO\textsubscript{y} mean horizontal distributions during boreal winter from the end of 1999 until 2017, for the products IAGOS-DM (left) and INCA-M (middle), and the biases (right) normalized with respect to the mean values between the two products. Each row displays a layer, with the non-separated UTLS at the top and the distinct LS and UT below.
Figure 10. As Fig. 9 for boreal spring.
Figure 11. As Fig. 9 for boreal summer.
4 Water vapour
Figure 12. As Fig. 9 for boreal fall.
Figure 13. Water vapour mean horizontal distributions during boreal winter from the end of 1994 until 2017, for the products IAGOS-DM (left) and INCA-M (middle), and the biases (right) normalized with respect to the mean values between the two products. Each row displays a layer, with the non-separated UTLS at the top and the distinct LS and UT below. Please note that the LS climatology is representative of lower altitudes than for the other species, as explained in the manuscript.
