

Dear Pascal Haegeli,

thank you very much for your detailed comments and suggestions! We have implemented the proposed language changes and clarified the passages where you indicated ambiguity in meaning.

You understood correctly that we extracted the mode and used majority as a synonym. We replaced all mention of majority with “most frequently chosen size” or similar and changed the corresponding notion of our variables.

As for the p-values: we have now replaced our classes with the exact values, except for $p < 0.001$ which we kept. We have however refrained from putting the exact values in Figure 6 and kept the classes. We believe there the readability of our Figure would suffer and would not outweigh the benefit of having exact p-values.

On behalf of all co-authors,
Elisabeth Hafner
