I revised the manuscript entitled: "Cobalt Distribution in the Boleo Stratiform Sediment-Hosted
Ore Deposit; A Transtension Rift Basin in Central Baja California Peninsula, Mexico".

The manuscript is an interesting contribution to the understanding of the distribution of Cobalt
in the Boleo copper deposit (in Central Baja California Peninsula, Mexico).

In addition, to cobalt distribution mapping, this article extends the distribution of gypsum in the
Santa Rosalia Basin to the surface and subsurface. In general, this article provides a valuable
insight for further exploration and understanding of cobalt mineralization in similar geological
settings.

The article is well written in English and structured, so the research work **can be accepted**.
