18 1. Methods

19 1.1 FT-ICR MS analysis

20 FT-ICR MS was calibrated using a reference list formed by the manually assigned
21 known formula in Data Analysis. Mass peaks with a signal-to-noise (S/N) ratio ≥ 4
22 were exported to a data sheet. Data analysis was performed using in-house software.
23 The assigned formulae were limited in the following elemental composition: $^{12}\text{C}_{0-100}$,
24 $^1\text{H}_{0-200}$, $^{14}\text{N}_{0-10}$, $^{16}\text{O}_{0-20}$, and $^{32}\text{S}_{0-2}$. The formula assignment section set the mass accuracy
25 window was set to 1.0 ppm in formula assignment section. All elemental formulae
26 should meet basic chemical criteria: (1) the number of H atoms should be at least 1/3
27 that of C atoms and cannot be greater than that of $2\text{C} + \text{N} + 2$; (2) the sum number of
28 N and H atoms should be even; and (3) the H/C and O/C value should be restricted to
29 be less than 3 and 1.5, respectively.

30 These compound groups were: ; lipids (O/C = 0–0.2, H/C = 1.7–2.2); Aliphatics (O/C
31 = 0.2–0.6, H/C = 1.5–2.2); lignin (O/C = 0.1–0.6, H/C = 0.6–1.7, $\text{AI}_{\text{mod}} < 0.67$);
32 carbohydrates (O/C = 0.6–1.2, H/C = 1.5–2.2); tannins (O/C = 0.6–1.2, H/C = 0.5–1.5,
33 $\text{AI}_{\text{mod}} < 0.67$); unsaturated hydrocarbons (O/C = 0–0.1, H/C = 0.7–1.5); saturated
34 compounds (H/C > 2.0); polycyclic aromatics (PCAs, $\text{AI}_{\text{mod}} \geq 0.67$); polyphenols (0.67
35 $\geq \text{AI}_{\text{mod}} \geq 0.50$); and highly unsaturated compounds ($\text{AI}_{\text{mod}} < 0.50$, H/C < 1.5)

36 The double bond equivalent (DBE) and modified aromaticity index (AI_{mod}) value are
37 calculated as Eqs. S1 and S2 (Koch and Dittmar, 2006; Koch and Dittmar, 2016):

$$38 \quad \text{DBE} = \text{C} - 0.5\text{H} + 0.5\text{N} + 1 \quad (\text{S1})$$

$$39 \quad \text{AI}_{\text{mod}} = (1 + \text{C} - 0.5\text{O} - \text{S} - 0.5\text{H}) / (\text{C} - 0.5\text{O} - \text{S} - \text{N} - \text{P}) \quad (\text{S2})$$

40 A Kendrick mass defect (KMD) analysis is used to provide an overview of the
41 composition of the identified formulae in NFC samples. The KMD calculations are
42 shown in Eqs. (S3 and S4) (Sleighter and Hatcher, 2007):

$$43 \quad \text{Kendrick mass (F)} = (\text{observed mass}) \times \frac{\text{nominal mass(F)}}{\text{exact mass(F)}} \quad (\text{Eq. S3})$$

$$44 \quad \text{KMD} = \text{nominal mass} - \text{Kendrick mass (F)} \quad (\text{Eq. S4})$$

45 where F stands for the functional groups or repeated groups, including COO, OO,
46 CH₂O, and H₂O.

47

48 The value of X_c is used to characterize aromatic and polyaromatic compounds in highly
49 complex compound mixtures. X_c normally ranges from 0 to 3.0 and is calculated as Eqs.
50 (S5) (Yassine et al., 2014):

$$51 \quad X_c = \frac{3(\text{DBE} - mN_O - nN_S) - 2}{\text{DBE} - mN_O - nN_S} \quad (\text{Eq. S5})$$

52 If $\text{DBE} \leq mN_O + nN_S$, then $X_c = 0$. For (-)ESI and (+)ESI mode, we used $m=n=0.5$ and
53 $m=n=1.0$ for the X_c in this study.
