1. One-dimensional example of Second Order Central Difference method

To introduce the divergence calculation based on a grid scale, a one-dimensional example is illustrated here. If we aim to calculate the SO₂ divergence of grid \( i \) along the \( x \) direction, the calculation can be represented as follows:

\[
D_{x(i)} = \frac{\vec{F}_{x(i+1)} - \vec{F}_{x(i-1)}}{2\Delta x}
\]

\[
\vec{F}_{x(i+1)} = \vec{\bar{w}}_{x(i+1)} \cdot V_{x(i+1)} \tag{1}
\]

\[
\vec{F}_{x(i-1)} = \vec{\bar{w}}_{x(i-1)} \cdot V_{x(i-1)}
\]

In this equation, \( \vec{F}_{x(i)} \) denotes the flux of SO₂ in grid \( i \) along \( x \) direction, \( \Delta x \) is the resolution of the grid-scale data. \( \vec{\bar{w}} \) is the wind along \( x \) direction. \( V \) is SO₂ VCD. The total divergence of each grid cell is the sum of the divergence in \( x \) and \( y \) directions.
2. SO₂ chemical lifetime

Figure S1. SO₂ monthly mean chemical lifetimes in India. The chemical lifetimes in each month are averaged within December 2018 to November 2023. The white region represents the areas with surface height above 3 km or the areas without high-quality SO₂ measurements and are not discussed in this study.
3. SO₂ dry deposition lifetime

Figure S2. SO₂ monthly mean dry deposition lifetime in India. The dry deposition lifetime in each month is averaged over December 2018 to November 2023. The white region represents the areas with surface height above 3 km or the areas without high-quality SO2 measurements and are not discussed in this study.
4. SO$_2$ effective lifetime

Figure S3. SO$_2$ monthly mean effective lifetime in India. The effective lifetime in each month is averaged within December 2018 to November 2023. The white region represents the areas with surface height above 3 km or the areas without high-quality SO$_2$ measurements and are not discussed in this study.
5. SO$_2$ daily distribution in one-dimension

![SO$_2$ VCD gradient](image)

![SO$_2$ VCD](image)

![SO$_2$ divergence](image)

Figure S4. Illustration of a one-dimensional example of the (a) SO$_2$ concentration gradient, (b) daily SO$_2$ concentration and (c) the SO$_2$ divergence calculated with SOCFDM. The blue cylinder represents a point source of SO$_2$.

**Formula of method A:**
We set gradient of grid cell $i$ ($Grad_{(i)}$) as:

$$Grad_{(i)} = V_{(i)} - V_{(i-1)}$$

When the divergence at the left edge of grid cell $i$ ($D_{LE(i)}$) is needed to be allocated, we select between the gradient at the left side and at the right side of the edge, according:

If $Grad_{(i+1)} > Grad_{(i-1)}$

Then $D_{(i)} = D_{(i)} + D_{LE(i)}$

Else $D_{(i-1)} = D_{(i-1)} + D_{LE(i)}$
When the divergence at the right edge of grid cell $i$ ($D_{RE(i)}$) needs to be allocated:

If $Grad_{(i)} > Grad_{(i+2)}$
Then $D_{(i)} = D_{(i)} + D_{RE(i)}$
Else $D_{(i+1)} = D_{(i+1)} + D_{RE(i)}$
6. SO$_2$ daily concentration distribution in two dimensions

Figure S5. SO$_2$ daily VCDs on 8th December 2019. The green circles represent power plants.

**Formula of method B:**

When the divergence at the left edge of grid cell $i$ ($D_{LE(i)}$) is needs to be allocated:

If $V_i > V_{i-1}$

Then $D_{(i)} = D_{(i)} + D_{LE(i)}$

Else $D_{(i-1)} = D_{(i-1)} + D_{LE(i)}$

which means always allocate the edge divergence to a grid cell with the larger SO$_2$ VCD.
7. Comparison between the emissions derived with method A and method B.

Figure S6. (a) The emissions derived with method B in the winter season (DJF) of 2019/2020 is shown. (b) The difference from emissions derived with method B and method A. The black circles represent the locations of the top 50 emission sources in the CAMS-GLOB_ANT v4.2 inventory.
8. Emissions detection threshold

Figure S7. Histogram of the frequency of SO$_2$ emissions. The resolution of the bins is 0.1 Gg year$^{-1}$. The red bars represent the frequency of SO$_2$ emissions within the whole domain. The blue bars denote the frequency of SO$_2$ emissions (or the noise) in the selected clean oceanic region (latitude: 5°N-18°N; longitude: 85°E- 90°E), with $\sigma = 0.52$. 
9. SO₂ emissions derived with fixed 6-hour lifetime

Figure S8. (a) The annual mean SO₂ emissions with a fixed 6-hour lifetime averaged within December 2018 to November 2023. (b) shows the emissions above the detection threshold of 2.0 Gg year⁻¹. (c) and (d) are the zoom-in areas. The blue triangles represent the source locations identified by the MSAQSO₂LV4 dataset. The green circles represent the locations of thermal power plants with annual power generation larger than 500MW.
10. Top 10 sources location

Figure S9. The locations of top 10 of highest emission sources in our inventory. (from © Google Maps 2024)
