

Dear Editor

I have already reviewed the article, and I have verified that the authors have made most of the requested corrections, so for me the article is ready to be accepted and continue with the publication process. However, and as a recommendation, the authors to be more careful when talking about surface seismicity associated with these translithospheric structures/faults. If they are going to continue working on this type of structures, please be more rigorous when talking about seismicity and not just naming, without clear evidence of seismicity, that these faults present seismicity.

Best regard and thanks for all.
