

## Supplements for RC1

### Supplement 1 Revised Fig. 9 (now Fig.10 in the revised manuscript)

**Figure 10** Variation of the MSLP and smartphone coverage ratio during (a) TC Lekima from 14:00 LST on August 10 to 05:00 LST on August 11, 2019, (b) TC Hagupit from 20:00 LST on August 4 to 02:00 on August 5, 2020, and (c) TC IN-FA from 05:00 LST on July 27 to 23:00 LST on July 29, 2021. Green, blue and orange dots represent the MSLP from weather stations, STI best track and unlabeled smartphones, with a temporal resolution of 3, 3 and 6 hours respectively. Red shaded areas represent the lowest 10% labeled smartphone pressure. Gray bars represent smartphone coverage ratio. All the statistics were done in the area of  $1.2^\circ \times 1.2^\circ$  surrounding the TC center.

**Supplement 2** Revised Tab. 1

**Table 1** Descriptive features of the two machine learning models

| <b>Unlabeled data</b>       | <b>Labeled data</b> |
|-----------------------------|---------------------|
| Longitude                   | Longitude           |
| Latitude                    | Latitude            |
| Month                       | Month               |
| Date                        | Date                |
| Moment                      | Time                |
| Land-use type               | Day of the Week     |
| Gridded pressure            | Smartphone pressure |
| Observations number         |                     |
| Pressure standard deviation |                     |

### Supplement 3 Revised Tab. 2

**Table 2** Hyperparameter settings of the two machine learning models

|                         | Unlabeled data | Labeled data |
|-------------------------|----------------|--------------|
| <b>max_depth</b>        | 9999           | 9999         |
| <b>max_samples</b>      | 0.7            | 0.7          |
| <b>min_samples_leaf</b> | 1              | 1            |
| <b>max_features</b>     | $\log(M+1)$    | M            |
| <b>n_estimators</b>     | 100            | 30           |

All parameters are from the function “RandomForestRegressor” of the Scikit-learn machine learning library in Python (Pedregosa et al. 2011).

**max\_depth**: The maximum depth of the tree (also known as “the base estimator”).

**max\_samples**: The proportion of samples to draw from the training set to train each tree when bootstrapping.

**min\_samples\_leaf**: The minimum number of samples required to be at a leaf node.

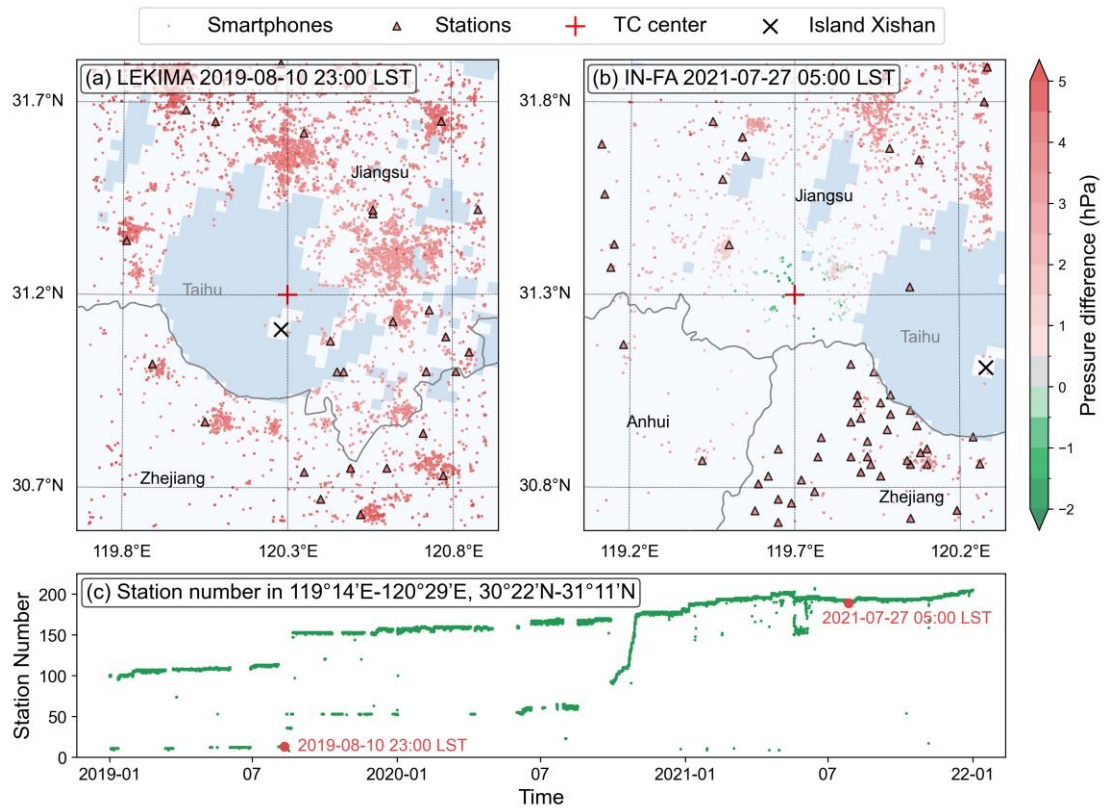

**max\_features**: The number of features to consider when looking for the best split. M represents the number of features used by the model.

**n\_estimators**: The number of trees in the forest.

Supplement 4 Revised Fig. 10 (now Fig.11 in the revised manuscript)

**Figure 11** Distributions of weather station and smartphone observations from two examples during (a) TC IN-FA and (b) TC Lekima, in the area of  $1.2^{\circ} \times 1.2^{\circ}$  surrounding the TC center. The coloring represents the difference between the pressure observations and the STI best track MSLP. (c) Changes in the number of weather stations providing pressure observations from 2019 to 2021, in  $119^{\circ}14'E-120^{\circ}29'E$ ,  $30^{\circ}22'N-31^{\circ}11'N$  (the geographical scope of Huzhou, Zhejiang Province).
