This file contains 6 supplementary figures and 1 supplementary table.

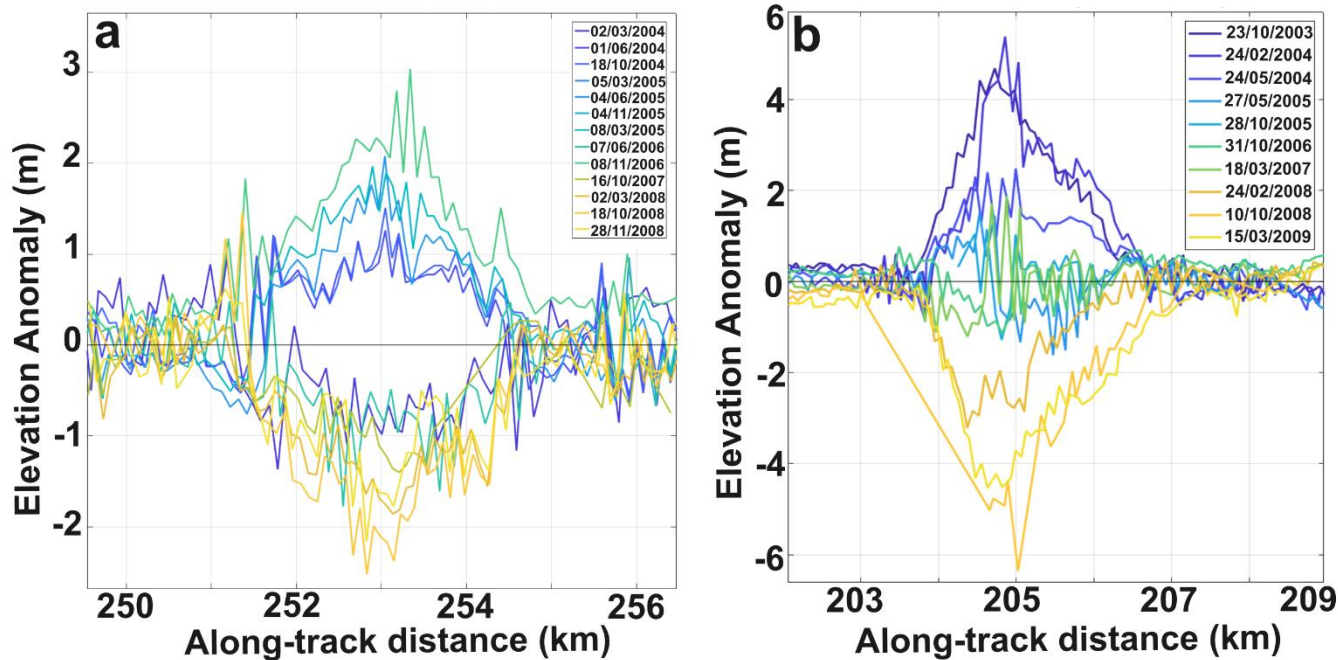

Supplementary Figure 1: Availability of time-stamped 2-m REMA strips over lakes identified from satellite altimetry, coloured according to partial coverage (blue) or full coverage (purple) of each lake.

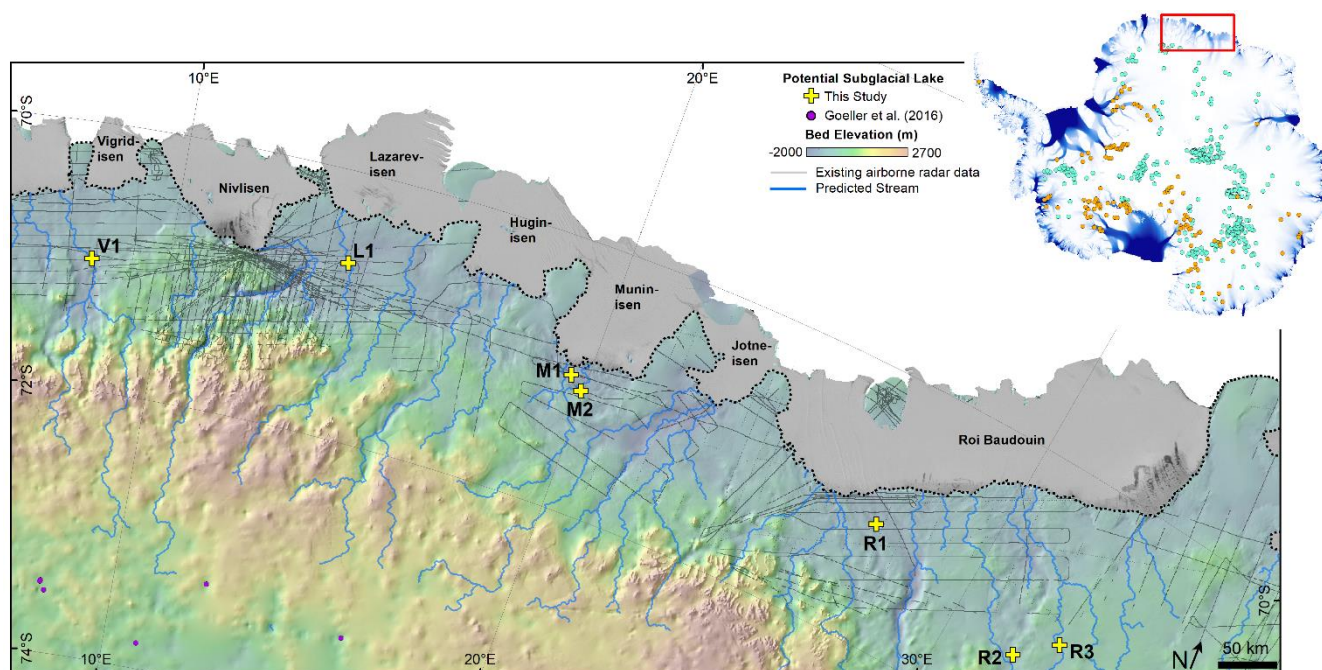

Supplementary Fig. 2: Ice surface elevation change from REMA strip differencing for Lakes R1 (a) and L1 (b). Regions of ice surface subsidence (yellow shading) between time-stamped REMA strip pairs (7th December 2016 – 21st December 2017 and 12th September 2015 – 10th December 2016) are delineated by the dashed lines. Each example highlights the spatial cooccurrence between localised ice surface subsidence and surface elevation anomalies along the intersecting ICESat-2 tracks, suggesting Lakes R1 and L1 were draining during the period bounded by the REMA strip pairs.

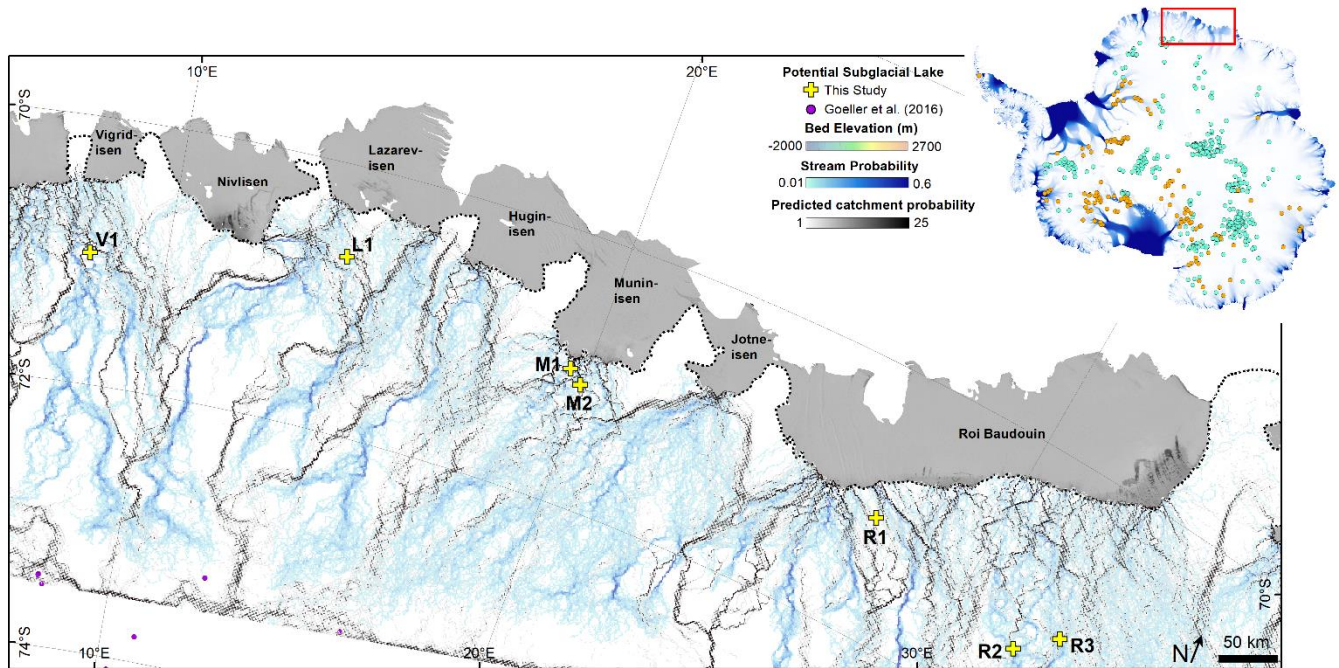

Supplementary Figure 3: Ice surface elevation displacements for Lakes V1, M1, M2, R2 and R3 derived from ICESat-2. Transects X-X' in each panel highlight significant (>1 m) ice surface elevation anomalies along ICESat-2 tracks. Graphs show along-track ice surface elevation displacements relative to ICESat-2 Cycle 3 (April/May 2019). Colours correspond to individual ICESat-2 cycles.

Supplementary Figure 4: Ice surface elevation displacement anomalies from two ICESat tracks over and Lake L1 (a, Track 134) and Lake R1 (b, Track 21). Elevation anomalies are calculated with respect to surface plane fits representing averaged surface elevation.

Supplementary Figure 5: Example of predicted streams from water routing analysis for one of 50 stochastic simulations. Newly-identified active lakes in this study are shown in yellow and previously-identified subglacial lakes from Goeller et al. (2016) are shown in purple. The dashed black line is the MEaSUREs grounding line (Rignot et al., 2016) and the bed elevations are from BedMachine (Morlighem et al., 2022). Ice-shelf imagery is from the MODIS mosaic (Haran et al., 2021). Subglacial lake locations depicted in the inset map are from Livingstone et al. (2022), where active lakes are represented by orange dots and stable lakes by green dots.

Supplementary Figure 6: Probability of subglacial drainage basin boundaries over the ensemble of 50 stochastic simulations derived from water routing analysis. The dashed black line is the MEASUREs grounding line (Rignot et al., 2016) and ice-shelf imagery is from the MODIS mosaic (Haran et al., 2021). Subglacial lake locations depicted in the inset map are from Livingstone et al. (2022), where active lakes are represented by orange dots and stable lakes by green dots.

Supplementary Table 1: Details of time-stamped 2-m REMA strips used in DEM differencing, including vertical elevation bias from co-registration with ICESat-2 (calculated as the average difference between DEM strip elevations and closest contemporaneous ICESat-2 elevations along overlapping ICESat-2 tracks), standard deviation in elevation bias and time difference between REMA strip acquisition date and the closest contemporaneous ICESat-2 elevation data. Elevation bias and time difference could not be calculated for the four final strips due to lacking contemporaneous ICESat-2 data.

REMA Strip Date	Location	Satellite	Elevation bias from ICESat-2 (m)	σ (m)	Time difference (days)
22 nd October 2019	Roi Baudouin Ice Shelf	Worldview-1	-0.70	0.52	69
10 th January 2021	Roi Baudouin Ice Shelf	Worldview-2	-2.41	1.20	15
18 th January 2021	Roi Baudouin Ice Shelf	Worldview-1	-0.98	0.29	11
28 th December 2022	Roi Baudouin Ice Shelf	Worldview-1	0.52	0.24	62
25 th January 2020	Lazarev Ice Shelf	Worldview-1	3.53	0.42	12
15 th February 2021	Lazarev Ice Shelf	Worldview-3	-2.10	0.42	12
12 th September 2015	Lazarev Ice Shelf	Worldview-1	-	-	-
10 th December 2016	Lazarev Ice Shelf	Worldview-1	-	-	-
