15 **Figure S1.** The location of culturable airborne microorganisms and experimental procedures. (a) The map shows the location of Tianjin city and the sampling site in the Nankai district, Tianjin (the map is from Ocean Data View). (b) Experimental procedures include the isolation of atmospheric microorganisms, collection of metabolites, and exometabolite analysis.

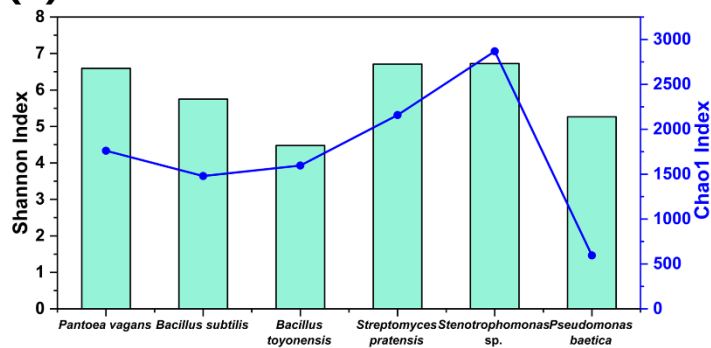

20 **Figure S2.** The representative bacterial (a) and fungal (b) strains isolated atmospheric microorganisms.

25 **Figure S3.** Mass spectra and different categories of organics in the initial medium. The subfigures on the left illustrate the mass spectra and elemental compositions of TSB (a) and SDB (c) media. The right subfigures display the formula numbers of different categories of organic matter for TSB (b) and SDB (d) media.

Figure S5. The formula categories in bacterial exometabolites and differences in the molecular composition of shared and unique exometabolites among bacterial strains. (a) Stacked bars illustrate formula categories based on H/C and O/C ratios in bacterial exometabolites, and pie charts illustrate the elemental compositions of high abundance categories. (b) van Krevelen diagrams illustrate the shared molecules. Radar maps show the distribution of oxygen number of unique CHO compounds in exometabolites from *Pantoea vagans* (c) and the distribution of oxygen number of unique CHONS compounds in exometabolites from *Stenotrophomonas sp.* (d) and *Pseudomonas baetica* (e).

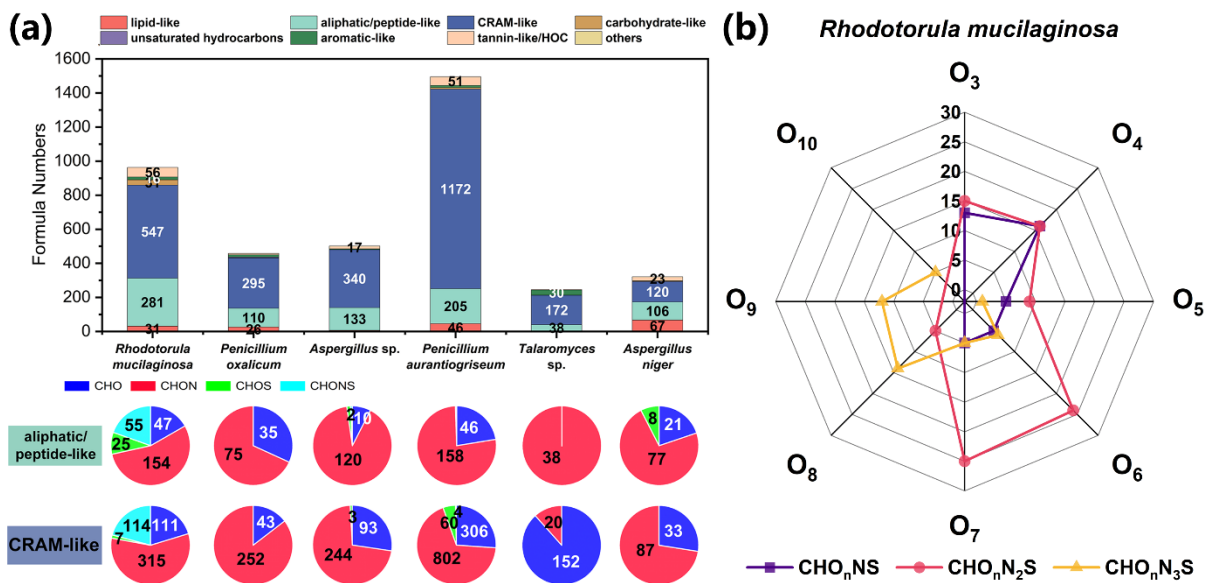

Figure S6. The formula categories in fungal exometabolites (a) and the distribution of oxygen number of unique CHONS compounds in exometabolites from *Rhodotorula mucilaginosa* (b). Stacked bars illustrate formula categories based on H/C and O/C ratios in fungal exometabolites, and pie charts illustrate the elemental compositions of high abundance categories.

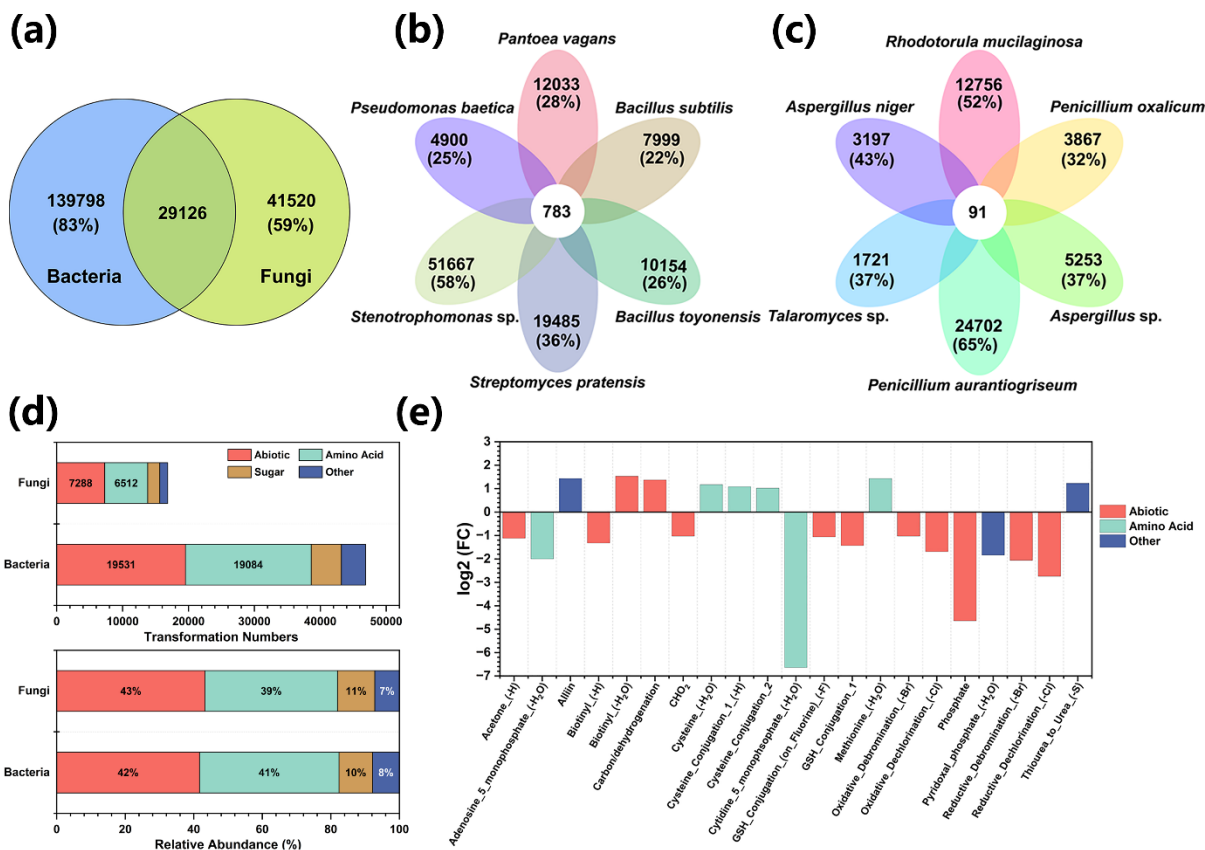

Figure S7. Changes in the supernatant of the genera *Penicillium* and *Talaromyces* culture medium after 14 days.

45 **Figure S8.** The differences in molecular transformations of bacteria and fungi. Venn diagrams display the numbers and percentages of shared and unique potential molecular transformations of bacteria and fungi (a), typical bacteria (b), and typical fungi (c). The percentages in the graph represent the ratio of unique transformations to the total number of transformations of the strain. (d) Bar diagrams show the grouped distribution of the transformation numbers and the relative abundance of bacteria and fungi. (e) Bar diagram illustrates the distribution of transformation types with significant differences (Fold Change (FC) ≥ 2 or ≤ 0.5) between bacteria and fungi. $\log_2(FC) \geq 0$ indicates that this transformation type is more significantly represented in bacteria.
