1 Information on α -pinene ozonolysis experiments

α -Pinene ozonolysis particles were generated in a continuous flow experiment in an 8 L glass flow tube and collected with the sequential spot sampler (Aerosol Devices Inc.) over a 24 h period. Ozone was introduced by passing 2 L/min of clean "zero" air (model 747-30, Aadc Instruments) over an Hg UV lamp (model 90-0004-04, UVP, LLC). α -Pinene was introduced by taking 0.09 L/min from a gas cylinder containing 16.7 ppm of precursor. Reagent flows into the tube were mixed and diluted with zero air to achieve a total inlet flow of 4.6 L/min and concentrations of >1 ppm ozone, as monitored by an ozone analyzer (model 106L, 2B Technology), and an estimated 330 ppb α -pinene. Particles were collected at 3 L/min in a single sample well and extracted in 70 μ L of a 1:1 mix of acetonitrile HPLC grade, Sigma Aldrich) and water (HPLC grade, Sigma Aldrich) for 30 min. Extract was analyzed with no further preparation using the same LC/MS method described in the main text.

Figure S1. (A) Sample inlet head located near the tree canopy top at the KM67 measurement site (2.857° S, 54.959° W). (B) 30 m sampling line connecting inlet head to instrument housing below. (C) Sequential spot sampler with nano-DMA (TSI, model 3085) connected upstream.

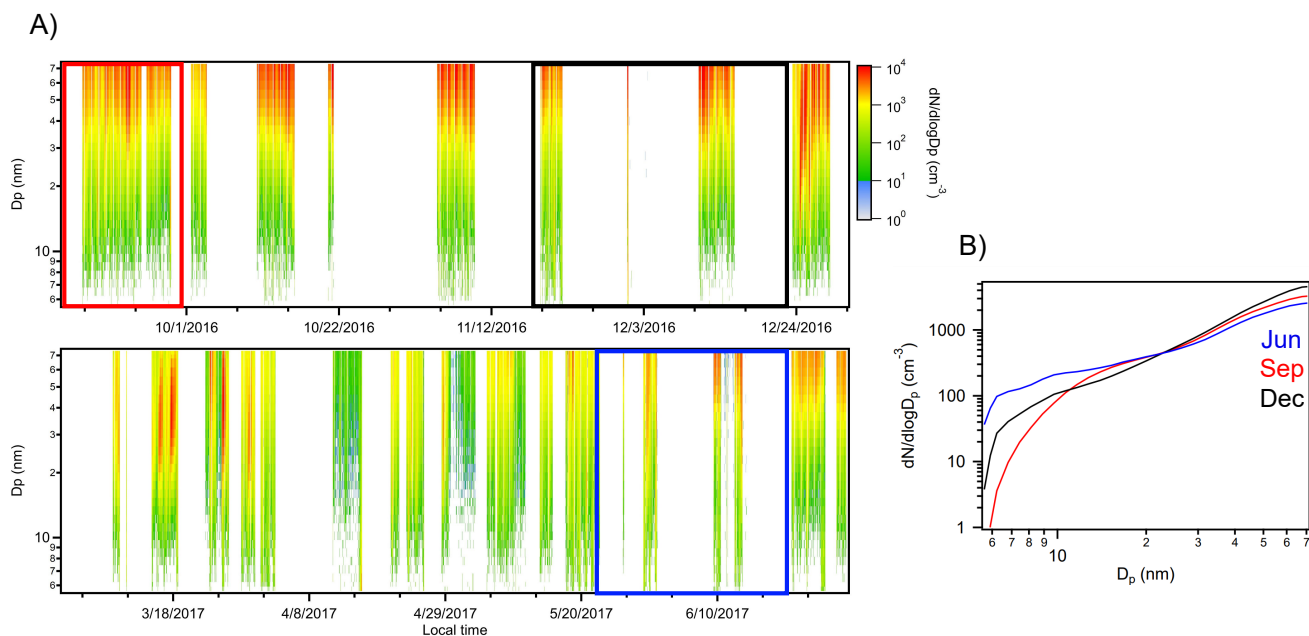

Figure S2. (A) Particle number-size distribution measurements (scanning particles with diameters 5 - 70 nm) taken at the Km67 measurement site from September 2016 through June 2017. The top panel roughly corresponds to the late dry season (September - December) while the bottom corresponds to the wet season (January - June) and wet-dry transition (June-July). White bars indicate when instrument was not working properly. (B) Average particle number-size distributions for the three seasonal periods when particles were sampled. Sep: 10 - 30 September 2016 (red), Dec: 18 November - 23 December 2016 (black), Jun: 22 May - 21 June 2017 (blue).

Figure S3. Representative MS2 fragmentation spectrum with major peaks assigned for m/z 215.023 as observed in SEP.

Figure S4. Representative MS2 fragmentation spectrum with major peaks assigned for m/z 187.061 as observed in SEP. Starred ions are fragments with same unit masses reported by Kahnt et al. (2014) for hydroxyterpenylic acid isomers.

Figure S5. Extracted ion current chromatograms for m/z 187.098 (assigned a neutral formula of $C_9H_{16}O_4$) as observed in SEP (red), DEC (black) and from the α -pinene ozonolysis experiments (a-pinene SOA) (green).

Figure S6. (A) Representative MS2 fragmentation spectrum with major peaks assigned for m/z 203.056 in SEP (top) and from the α -pinene ozonolysis experiments (bottom). Peaks highlighted in red for SEP are suspected contamination/interference as they could not be assigned CHO formulae. (B) Proposed fragmentation mechanism based on Szmigielski et al. (2007).

Figure S7. Extracted ion current chromatograms for m/z 203.056 (assigned a neutral formula of $C_6H_{16}O_4$) as observed in SEP (red), DEC (black) and from the α -pinene ozonolysis experiments (a-pinene SOA) (green).

Figure S8. Distribution of double bond equivalents (DBE) for CHO-containing molecules observed in each seasonal period. Marker size indicates ion relative abundance.

Figure S9. Van Krevelen diagram of the CHON molecules observed in JUN (blue circles) and DEC (red squares). Marker size indicates relative ion abundance.

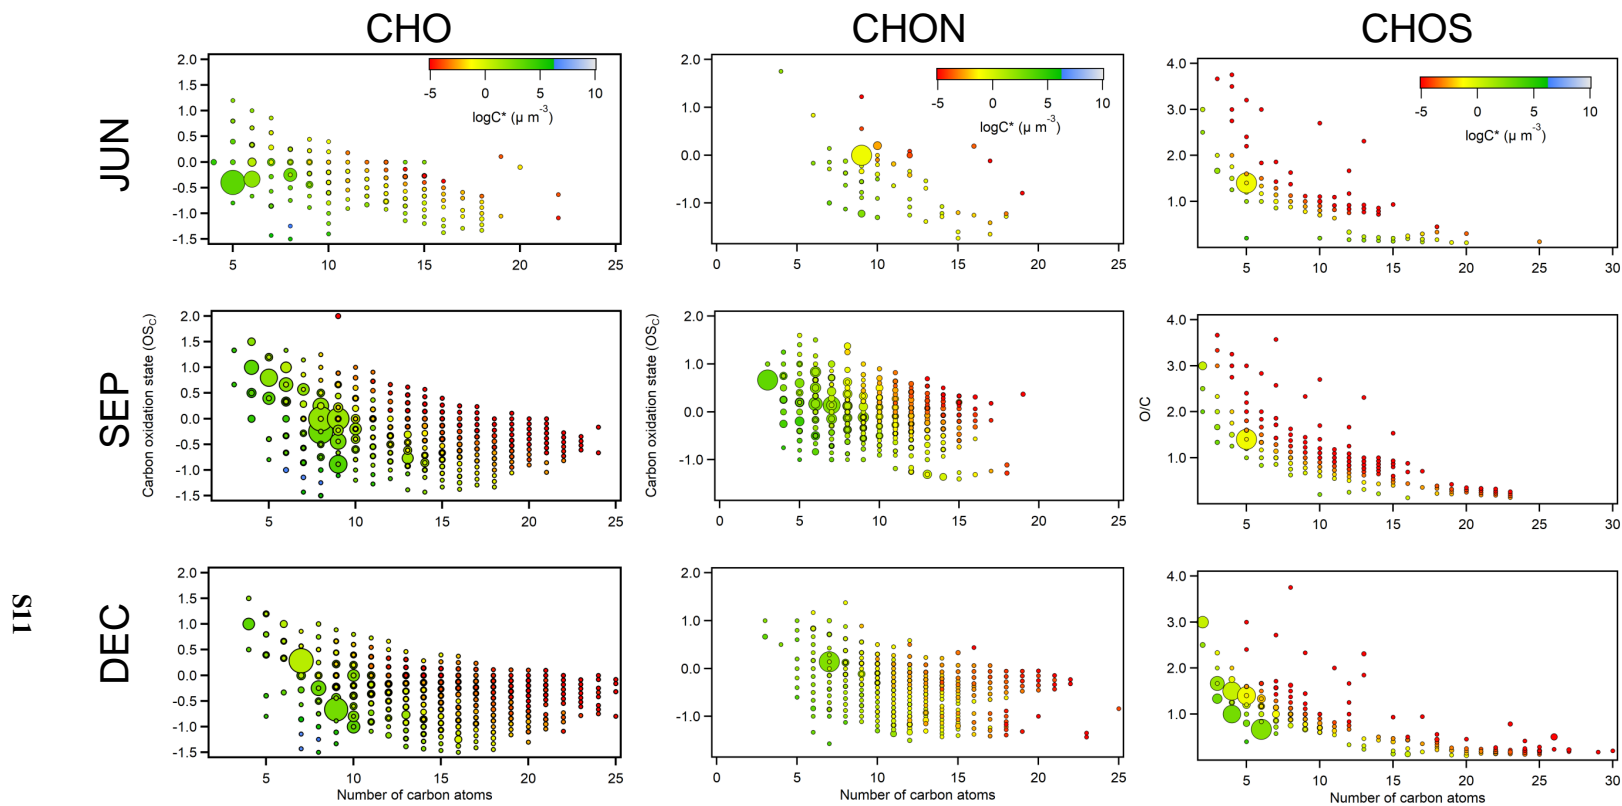

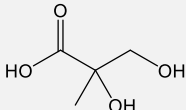

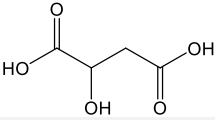

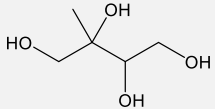

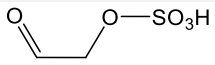

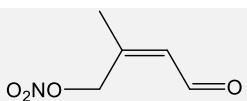

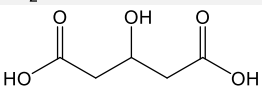

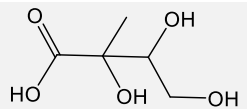

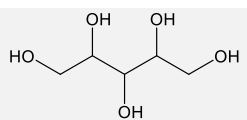

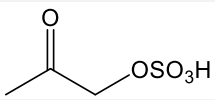

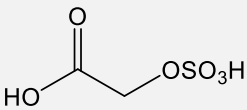

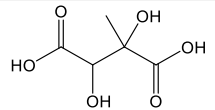

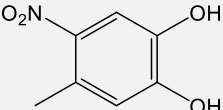

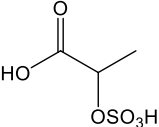

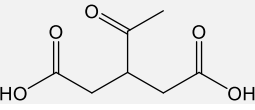

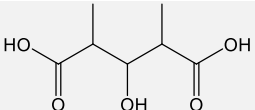

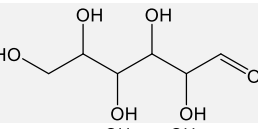

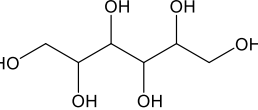

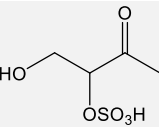

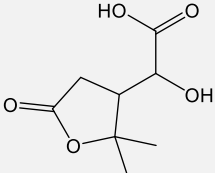

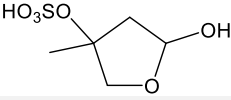

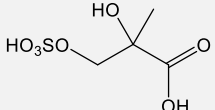

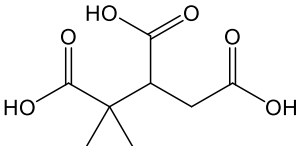

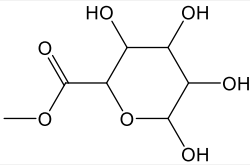

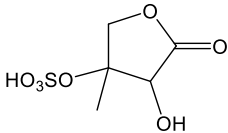

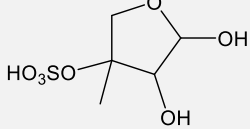

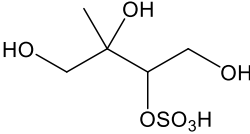

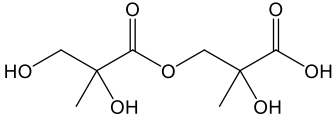

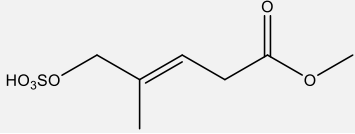

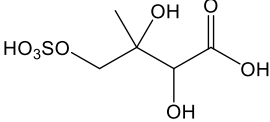

Figure S10. Molecular volatility distributions ($\log C^*$, color axis) depicted as a function of carbon oxidation state and carbon number for the three main compound classes observed in each seasonal period. The warmer the color the lower the saturation concentration (lower volatility). CHOS molecules are depicted against O/C ratio instead of carbon oxidation state to avoid functionality assumptions due to the likely strong presence of organosulfate species.

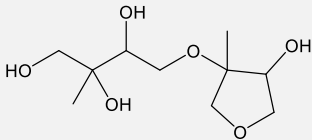

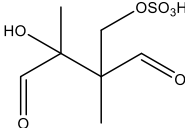

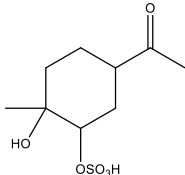

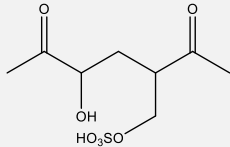

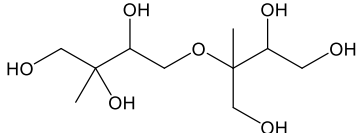

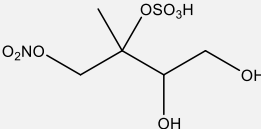

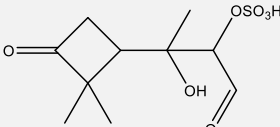

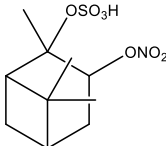

3 Supporting Tables

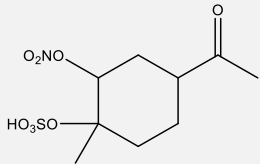

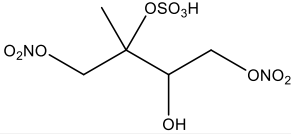

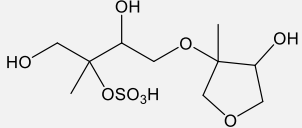

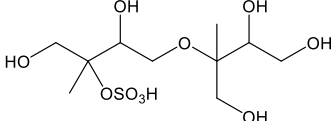

Table S1. List of observed compounds discussed in main text with suggested chemical structures and potential sources.

Theoretical m/z ([M-H] ⁻)	Molecular Formula ([M-H] ⁻)	Suggested Parent Structure	Sample(s) Observed*	Mass Error(s) (ppm)	Potential Source(s)**
