14 **Abstract.** A variety of skills can be taught alongside course content. In the University of Canterbury third-year
15 course on magmatic systems and volcanology, we chose to focus on teaching bicultural competence and science
16 communication while transforming the course to a more skills-based, flexible, flipped classroom model. We
17 document the development process and measure student perceptions associated with these skills. We used two
18 edX massive open online volcanology courses (MOOCs) as skills-focussed learning resources to replace lectures
19 and supplement hands-on laboratory and tutorial sessions to teach volcanology.
20 We compare the skills-focussed courses with baseline data from 2021, gathered during an initial iteration of the
21 course which included interactive volcanology lectures, and an online Iceland virtual fieldtrip component. The
22 new course was developed using the original 2021 Iceland virtual fieldtrip to create the two virtual fieldtrip-based
23 MOOCs with new bicultural and science communication components. To achieve this, we used cultural advisors
24 from connections through NZ research programs and kaiārahi (Māori learning advisors) from the University of
25 Canterbury. In the course, these experts ensured appropriate cultural guidance at specific volcanic sites and
26 appropriate assessments. Mātauranga (Māori knowledge) of volcanoes is included and taught by video of kōrero
27 (oral knowledge) from members of mana whenua (tribes local to the volcanoes) in the areas that are visited in the
28 course.
29 In this paper we describe the development of a flipped classroom MOOC featuring bicultural competence and
30 science communication skills, and we report students' reflections on learning with a focus on these featured points.
31 We analyse student reflections and comments from the two iterations of the online content by specifically coding
32 for comments regarding skills learnt. Student responses to the reflective question *What did you learn in this course*
33 *and why is it important to you and/or your potential career?* show a marked shift between the years. In the new
34 2022 course, students' reflections were more likely to highlight a skill rather than content, and there was a large
35 increase in students who reported science communication or bicultural competence as a potential skill that would
36 be useful to them. Student quotes from throughout the course and in response to the reflective question- *Has this*
37 *course influenced your bicultural competence?* are used to explore how and why these skills were valued by the
38 students. These courses provide a freely available and potentially flexible model to teach bicultural and science
39 communication skills alongside volcanology.

40 **1 Introduction.**

41 Geoscience instructors teach content and skills in a variety of settings, e.g., lectures, laboratories, online modules,
42 projects, and in person and virtual field experiences. To learn and master new skills students need to employ
43 adaptive expertise techniques (Bohle Carbonell et al., 2016) and distributed practice (Benjamin & Tullis, 2010)
44 by practicing skills multiple times and in different scenarios. Bicultural confidence is a valued skill in Aotearoa
45 New Zealand¹, and cultural confidence and competence is important globally and inherently linked to sense of
46 place, a key concept in the geosciences (Apple et al., 2014). However, cultural competence is rarely taught in
47 geoscience courses (Mosher and Keane, 2021). Here, we present how we integrated a new skills-based learning
48 goal (including bicultural confidence) into the course. This additional learning goal was introduced and assessed
49 in a 3rd year volcanology course using two massive online open courses (MOOCs) and a flipped classroom model.
50 Here, we define flipped classroom in our context as a teaching format where the majority of the content is
51 transferred outside of scheduled class time via an interactive MOOC, and face to face time is used following this
52 content for consolidating knowledge and reflecting on learning during workshops and labs.

53 Teaching and learning about volcanoes is of public and professional interest, particularly in countries with
54 significant volcanic risk like Aotearoa New Zealand¹. MOOCs are a method where both public, professional, and
55 institutional audiences can be reached (Rodrigues-Silva & Alsina, 2024) and skills important to become effective
56 volcanologists can be taught. Flipped classrooms provide a scenario where content is delivered outside the
57 classroom at students' own time and pace, and that "homework" is turned into more active learning that takes
58 place in the classroom (Bergmann and Sams 2012), although the flipped model is variably applied and assessed
59 (Kapur et al., 2022). Where flipped classrooms are combined with interactive online material (Wang and Zhu,
60 2019, Forbes et al., 2023), students can be given opportunities for adaptive expertise and distributed practice using
61 workshops and laboratories where feedback and reflection are used to cement learning of skills. However, both
62 MOOCs and Flipped classrooms have challenges. MOOCs have low completion rates and frequently lack
63 meaningful peer and instructor interaction (Khalil, H. & Ebner, M. 2014, Kurtz et al 2023), in contrast flipped
64 classrooms frequently require very high levels of "buy in" from both instructors and students (Collopy & Arnold
65 2009). Studies where MOOCs and flipped classrooms are combined report some benefits over the stand-alone
66 models (Ghadiri et al., 2013).

67 The aims of the study are to (1) describe the development of a flipped classroom MOOC targeting bicultural
68 competence and science communication skills, (2) report students' reflections on learning in 2021, and 2022, by
69 coding reflections for comments relating to bicultural competence and science communication. (3) Discuss how
70 the students' reflections relate to specific course developments by comparing the findings from 2021 and 2022
71 student reflections and focus groups.

72 **2 Literature context.**

73 **2.1 Geoscience Skills.**

74 Volcanology courses exist as part of a geoscience program where course development, such as introducing new
75 skills, is achieved by mapping knowledge, skills and attitudes across courses to ensure graduate learning
76 objectives are met that service the geoscience workforce (e.g., Mosher and Keane 2021). The required skills from
77 geoscience employers are communicated to faculties and professional bodies via research on job advertisements
78 (Shafer et al., 2023), focus groups (Nyarko and Petcovic, 2022), and working groups with academics (Mosher and
79 Keane, 2021). These studies show the skills most valued by employers; specifically writing, field and data
80 collection, planning, communication, teamwork and interpersonal skills. Therefore, it is important to consider
81 which of these skills are currently being taught within the curriculum (Keane et al., 2022; Mosher et al., 2014;
82 Viskupic et al., 2021), so we can identify the skill deficits that need to be taught.

83 A general survey of the workforce highlighted geoscience skills within geoscience courses at undergraduate
84 geoscience programs (Viskupic et al., 2021). The survey reported that geoscience skills (e.g. rock description),
85 data skills, and communication skills were commonly practiced across many courses, although it should be noted
86 that the communication skills reported were around communicating with peers and the instructor, and not
87 specifically relating to communicating with the public or those outside of geosciences. Complementary to this, a
88 status of geoscience graduates report (Keane et al., 2022) highlighted three areas for improvement amongst our
89 geology graduate students: 1. working across cultures; and 2. Communicating with the public; and 3. Working in
90 interdisciplinary teams. This report, coupled with ongoing curriculum reform at the University of Canterbury,

91 provided motivation to develop, implement and research the integration of these skills within an existing 3rd year
92 volcanology course.

93 A range of practice-oriented, authentic, and/or work integrated tasks and assessments have been shown to be
94 effective at developing graduate attributes in education and nursing (Gulikers et al. 2004; Karunanayaka and
95 Naidu, 2021). These tasks range from work placements, fieldtrips, and simulations, to practice oriented or
96 authentic assessments (Kaider et al. 2017). Work placements and fieldtrips have been shown to be effective
97 authentic experiences aligning with desired skills (Miller and Konstantinou, 2022), but they are also time and
98 resource intensive, expensive, and not always equitable experiences (Kaider et al., 2017). Simulations and virtual
99 fieldtrips have been used which can be particularly affective when coupled with authentic assessment to augment,
100 achieve added value, or provide alternatives (Watson et al., 2023).

101 **2.2 Volcanology learning and teaching research.**

102 Recent research into teaching and learning in volcanology provides evidence for research gaps (Dohaney et al.,
103 20223a, 2023b). Volcanological learning and teaching research at a Tertiary level has focussed on research skills,
104 and field skills, followed by volcano monitoring, communication, teamwork and quantitative skills (Dohaney et
105 al., 2023a 2023b). In addition, a gap in research relating to addressing a lack of diversity is becoming increasingly
106 recognised and hence addressing this is a burgeoning area of research in geosciences (Gates et al., 2019; Mogk,
107 2021) and volcanology (Dohaney et al., 2023a; 2023b). Communication skills have been typically taught using
108 role play exercises and simulations (Harpp and Sweeney 2002; Nunn and Braud 2013; Barclay et al. 2011;
109 Teasedale et al. 2015; 2018; Dohaney et al., 2015; 2018) but also incorporated into lectures and labs (Whittecar,
110 2000; Gonzales and Semken, 2006).

111 **2.3 Cultural sensitivity in geoscience education.**

112 As much geoscience is landscape and place focused, it is inherently linked to culture (e.g. sense of place, Apple
113 et al., 2014) and cultural considerations can be crucial when working in the geosciences (Mosher and Keane,
114 2021). Despite this, working across cultures is rarely taught in the geosciences (Mosher and Keane, 2021).
115 Coincidentally, or consequently, diversity is low in geosciences compared to other sciences. Geoscience education
116 needs to be culturally responsive by explicitly centering Indigenous students, addressing racism, indigenous
117 identity, sovereignty, and data sovereignty (McKinley et al, 2023). Key strategies for indigenous student success
118 are multi-faceted, layered support, underpinned by the principles of respect, relationships, and responsibility
119 (Milne et al, 2016). Successful Earth science curricula for indigenous learners include outdoor education, a place
120 and problem-based structure, and the explicit inclusion of traditional indigenous knowledge. (Riggs, 2005).
121 Despite this, field trips are frequently cited as a barrier to indigenous students, due to family or tribal commitments
122 (recognising this will also impact other field-based disciplines) and/or general insensitivity to traditional
123 knowledge around place, (Marín-Spiotta et al., 2020; Carabajal & Atchison, 2020) and in particular around places
124 to be visited. Similarly, indigenous students face challenges on placement, including racism, discrimination,
125 misrecognition, and misrepresentation, and the importance of relationships for positive experiences (Pallas et al,
126 2022).

127 A recent study reports that culturally aware teachers, mentors or practitioners are an important factor in students
128 choosing the geosciences as a career (Todd et al., 2023). Appropriately incorporating traditional knowledge and

129 mentors into geoscience curriculum can improve communication and collaboration across disciplines and cultures,
130 and encourage creativity and problem solving (Smythe et al., 2017; 2020). Indigenous research frameworks can
131 enhance higher education by promoting relationality, multilogicality, and promoting equitable practices in
132 research, teaching, mentoring, and organizational leadership for indigenous students. (Reano, 2020)
133 Recent research in volcanology education has emphasized the use of authentic voices to teach cultural sensitivity
134 and indigenous knowledge across many cultures, particularly where volcanoes hold specific significance (Saha et
135 al., 2021). Cultural competence is an area of educational focus in Aotearoa NZ, as workplaces are increasingly
136 seeking employees with this skill set as the country strives to draw from all available knowledge, uphold treaty of
137 Waitangi obligations and equitable educational outcomes for Māori and non-Māori. Māori, the indigenous people
138 of Aotearoa NZ have their own knowledge system (Mātauranga Māori) and part of this are keen observational
139 and generational understandings of their local area and the history of past volcanic activity (Cashman & Cronin,
140 2008; King et al., 2008; Tapuke et al., 2019). Regrettably, Mātauranga Māori has been either exploited or
141 marginalized in science education (McKinley, 2005; Smith, 2012; Smith and Richie, 2013). Historically
142 institutional racism has often attenuated Māori experiences in science education leading to under achievement in
143 traditional measures of learning for Māori students and students from low socio-economic areas (Macfarlane &
144 Macfarlane, 2018). Braiding of Mātauranga Māori with geology can thus lead to increased public preparedness
145 and understanding of these natural processes (Bretton et al., 2018; Gabrielsen et al., 2018; King et al., 2008; Pardo
146 et al., 2015; Swanson, 2008; Tapuke et al., 2019).
147 The teaching of volcanology frequently underutilises indigenous knowledge sources. The new courses described
148 in this paper highlight the importance of weaving indigenous knowledge of areas studied, and the benefits that
149 could come from shared and woven knowledge. This work builds on approaches and relationships outlined and
150 defined in Saha et al. (2021, 2022). Indeed, the bicultural content used in the course in our research was in the
151 form of a virtual fieldtrip, and several videos were reused and repurposed from such previous work, as well as
152 additional videos recorded or sourced.

153 **2.4 MOOCs and flipped classrooms.**

154 The underlying concept of a flipped classroom is that the passive component of learning, the content delivery, is
155 done before class, and the active component of learning, discussion, problem solving and collaboration is done
156 with peers and instructors (Chen, 2016; Tan et al., 2017; Hu et al., 2019; Karagöl and Esen, 2019). “Content”
157 (reading or videos) is delivered outside the classroom, and “homework” (problem solving with peers and
158 instructors) is done in the classroom (Bergmann and Sams 2012). However, application and assessment of the
159 flipped classroom model is highly variable, and a meta-analysis of data suggests that contrary to the underlying
160 premise, it is not the active learning component of flipped classroom that drive measurable learning effects.
161 Interestingly, the use of an additional lecture after online content shows a significant measurable learning effect
162 (Kapur et al. 2022). Kapur et al. (2022) suggest a Fail (allow students to struggle with a problem), Flip (content
163 delivered), Fix (misconceptions are explored) and Feed (feedback from students and instructors) model. Although
164 this model is yet to be thoroughly tested, it emphasizes the role of allowing students to struggle, before or during
165 content delivery when flipping the classroom.

166 On the other hand, MOOCs are a rapidly growing global phenomenon designed to make education globally
167 accessible and allow students all over the world to learn from the world’s best educators. There are many MOOC

168 platforms, and most courses consist of a format of short 3-8 min videos, and a series of questions and discussion
169 boards, variably moderated by instructors and teaching assistants. However, MOOCs have high levels of students
170 not completing courses and students who are disengaged with content. Small open online courses (SOOCs) also
171 exist to address some criticisms of MOOCs, whereby small cohorts can more easily develop meaningful peer and
172 instructor interactions.

173 Massive open online courses (MOOCs) and flipped classrooms can be seen as occupying two end members of the
174 education spectrum in terms of individualised learning. MOOCs are designed to maximise the instructor reach,
175 by making material accessible to a great number of students. Flipped classrooms were suggested as an alternative
176 to the traditional classroom, as a methodology to promote active and tailored learning in classrooms by increasing
177 instructor and student interaction. The learning experience in a MOOC invariably ends up being uniform and less
178 personalised, whereas in a flipped classroom setting learning strives to be as individualised and personal as is
179 practical. In our model, we drew from Māori education pedagogies to merge the advantages of the MOOC and
180 flipped classroom formats. We deliver accessible online MOOC content with novel digital assessments and
181 activities, in addition to face-to-face labs and flipped style workshops with the goal of developing lecturer-student-
182 peer relationships and skill learning through reflection, discussion and connection to online environment. The
183 benefits of working face-to-face and building lecturer-student-peer relationships are well established and highly
184 effective Māori educational pedagogical techniques – kanohi-ki-te-kanohi and whanaungatanga respectively
185 (Kana & Tamatea, 2012, Bishop et al. 2014)

186 The changes to the course discussed and presented here were developed and implemented before and during the
187 context of COVID-19, and at a time when University of Canterbury had recently signed up to become part of
188 global MOOC platform edX. The COVID-19 pandemic has shown a growth in online and blended learning, and
189 with it a growth in the use of MOOCs (Aristovnik, et al. 2023). The post COVID-19 environment has seen a
190 strong global demand for flexible blended courses, providing both flexibility of online content but also providing
191 opportunities for face-to-face interactions when conditions allowed.

192 **3 Study setting and population.**

193 **3.1 Course information.**

194 The course that was the focus of the research is an elective undergraduate 3rd year Volcanology and Magmatic
195 systems course, part of a geology BSc degree at a research university (Watson et al., 2022; 2023). The volcanology
196 component of the course, the focus of this study, was redeveloped in 2022 following successful implementation
197 of an Iceland virtual fieldtrip module (Watson et al 2022; 2023). The Iceland virtual fieldtrip formed the basis for
198 MOOC development on the edX platform.

199 The redevelopment was driven by the instructor and informal conversations with Māori students in earlier
200 iterations of the course, and the realisation that there was a missed opportunity to develop skills relating to science
201 communication in the bicultural context of Aotearoa NZ. Of relevance is the strategic aims of University of
202 Canterbury towards upholding and uplifting Te Tiriti o Waitangi (The Treaty of Waitangi). This includes the
203 inclusion of Mātauranga Māori (Māori knowledge) and promoting the Bachelor of Science graduate profile of
204 bicultural competence and confidence as essential skills in a multicultural Aotearoa NZ. The course instructor
205 identified improving this outcome of the course as a key goal for this project.

206 The course development was made possible by a University of Canterbury program to foster professional
207 development, scholarship of learning, and leadership (University of Canterbury, 2024). Kennedy and Davidson
208 were provided with Distributed Leadership in Teaching Practice (DLTP) fellowships to explore the use of MOOCs
209 as tools to help flip the classroom at the University of Canterbury to provide flexible learning solutions for
210 students. The fellowships provided resources and time bought out from regular teaching research and admin duties
211 to develop a second MOOC, implement skills focussed assessment, and a model for the university to use MOOCs
212 to deliver online content and facilitate flipping of the classroom.

213 No student demographic data was directly collected for this research. However, we approximate gender
214 proportions from class enrolments and ethnicity from a yearly university-wide survey to provide readers with an
215 approximation of class demographics. In 2021, 48% of students identified as women, 50% of students identified
216 as men and 2 % as gender diverse. In 2022, 57% of enrolled students identified as women and 41% identified as
217 men and 2 % as gender diverse. In the university wide survey, of university students that were in 3rd year geology
218 programs from 2019–2021, 73% of the students were of European descent, 16% of Māori ancestry, 3% were of
219 Asian descent, 3% of Pacific origin and 3% had other unspecified ancestry.

220 It is also worth mentioning the impact of the COVID-19 pandemic on these two study populations. Neither cohort
221 was directly impacted by COVID lockdowns during the implementation of this course, although it is worth noting
222 that the 2022 cohort had a larger proportion of their degree affected by COVID-19, particularly missing out on
223 several face-to-face fieldtrips in other related courses as a result of covid lockdowns during other semesters of
224 their study.

225 **3.2 The development of the course -Learning goals, implementation, and materials.**

226 The course was significantly changed by adopting a flipped classroom MOOC. We used the opportunity offered
227 by these changes to intentionally target bicultural competence and science communication skills. We used a
228 constructive alignment approach, a method where we used our course learning goals to link all assessments (online
229 content, laboratory exercises and workshop questions) ensuring that all learning is tied back to our original desired
230 outcomes for students taking the course. This was additionally motivated by University strategy to provide student
231 focussed, flexible, accessible education for all students. In 2021, the course learning goals were as follows:

- 232 1. Realize the importance of igneous rocks in geology and to society.
- 233 2. Identify and classify igneous rocks and their geological environments.
- 234 3. Use geochemistry to explain why magma is generated, diversifies and erupts.
- 235 4. Use geochemical data, thin sections, and maps to reconstruct the magmatic and volcanological histories.
- 236 5. Discuss physical volcanological processes with relevance to magma properties.
- 237 6. Describe volcanic rocks in the field using examples from Iceland and New Zealand.

238
239 In 2022 this new learning goal was added:

- 240 7. Communicate science with different audiences and appreciate the value of Māori knowledge.

241
242 Baseline data was collected in August-October 2021. During this period, the course consisted of 6 weeks of
243 volcanology content, two interactive 50 min lectures a week (using in class exercises and live multiple-choice
244 quizzes), and a 2.5 hr hands-on laboratory and workbook (Table 1). The last two weeks of the course was devoted
245 to the Iceland Virtual Fieldtrip, an interactive online module and two flipped classroom style workshops (Table
246 2). Students wrote a final summative exam during exam week. Course level learning goals focused around
247 observing and explaining volcanic textures, landscapes, and processes, and interpreting eruption mechanisms and
248 histories (Watson et al., 2022,2023). Specific learning goals were outlined in each lecture, laboratory, and online
249 module.

250 The 2022 version of the course underwent a year of redevelopment working with online learning advisors,
251 Mātauranga Māori advisors, and working with a community of practice of other DLTP fellows. Online learning
252 advisors helped us design assessments and exercises that aligned to the learning goals and made use of
253 functionality embedded in the edX online learning environment. The edX learning environment provided a range
254 of assessment options with functionality that went beyond quiz questions. In addition to designing quiz type of
255 assessments that provided instant feedback to students, we were able to incorporate peer assessment and reflection
256 to promote engagement and learning at higher levels. The platform also enabled a seamless presentation of content
257 in multiple ways such as text, video (including 360 video), audio, as well as interactive content for students to
258 interact with in real time (e.g. interactive graphs, virtual simulations, interactive maps).

259 For cultural content and assessment design we worked with cultural and Mātauranga Māori advisors with whom
260 we had strong existing relationships that had been carefully built and supported through research grants. Previous
261 research showed that shared *relations* and *values* were crucial to create *space for sharing* where challenges and
262 emerging understandings could be repositioned (Saha et al., 2022). Through discussion with our cultural and
263 Mātauranga Māori advisors we obtained permission to reuse video segments mostly recorded for other purposes
264 (e.g. Saha et al., 2022). In addition, we worked closely with the Faculty of Science kaiārahi, literally translated as
265 the canoe steerer, but meaning (in this context) a cultural teaching and learning advisor. She helped us embed
266 cultural content and design culturally appropriate assessments to go along with the videos provided by our cultural
267 leaders and Mātauranga Māori advisors. We worked hard to embed the cultural aspects with assessment
268 throughout the course to avoid tokenism, by valuing the content through assessment and reflection.

269 Similar to 2021, the redeveloped course in 2022 consisted of 6 weeks of teaching, however now students were
270 expected to complete weekly 1.5-3 hrs worth of interactive online MOOC virtual fieldtrip work in their own time
271 and attend both a 50 min flipped workshop and 2.5hrs of lab work (Table 1). In lieu of a final exam, students
272 completed an applied science communication project which was handed in during exam week (Fig. 1). This
273 change in assessment reflected the shift towards achieving the new skills-based learning goals.

274 The lab content and work were identical for both groups, and the learning goals were still focussed around
275 observing, and explaining volcanic rocks and landscapes, and interpreting volcanic histories and mechanisms. As
276 mentioned earlier, the key difference was the additional learning goal introduced into all the online modules and
277 workshops, focussing on the skill of science communication to diverse audiences and around developing bicultural
278 competence. Space to achieve these extra learning goals was made by reducing the number of international
279 examples of volcanoes covered in lectures and by focussing on New Zealand and Iceland only.

280 Both the 2021 and 2022 versions of the course had online content that is interactive, with 360 videos, 3D rocks
281 and 3D landscapes, i.e., active, engaging online volcano science content. 360 videos and virtual rocks and
282 landscapes necessitated students to manipulate 3D space, and most activities have multiple choice, or drag and
283 drop questions with feedback provided for incorrect answers that guide students to think again or re-evaluate their
284 thinking in a particular direction (Table 3).

285 In 2021, the online content was only used during the last 2 weeks of the course. In 2022 the online content was
286 every week, and every module in the 2022 iteration of the course ended with an applied science communication
287 mapping activity. These skills orientated additional activities were introduced in the online content, in the
288 workshops and as an additional question in the laboratory workbooks. Some of the online science communication
289 tools in 2022 version also featured interactive online drawing exercises and peer assessment of other students'
290 answers, with marking rubrics that in most cases assessed cultural considerations (Table 3).

291 In 2022, we developed our flipped workshops (Table 2) to systematically incorporate exemplars of students'
292 online contributions, interactive questions used to promote mental ramp-up for students (Karpur et al, 2022) and
293 added focus on communication skills in the workbook questions and in class discussion. Additionally, in 2022, at
294 the end of each module students were asked to rate how confident they were to achieving learning goals and to
295 justify their responses at the end of each module (Fig. 2). This was implemented to guide the workshop part of
296 the course, where the instructor would review the student responses and focus on learning goals where students
297 were less confident (Fig. 2). Therefore, the workshop consisted of part lecture, which focussed on learning goals
298 where students were less confident and part reapplication and mastery of content in a different context through a
299 question that needed to be answered in a workbook.

300 In summary, the 2021 version of the course, had many elements of active learning in lectures, labs, and online
301 content but lacked the learning goal (7) Communicate science with different audiences and appreciate the value
302 of Māori knowledge. In 2021, only the last two weeks had a form of flipped classroom. In 2022, the class was
303 truly flipped aligning better with recent models of flipping of the classroom (e.g. Kapur et al., 2022), allowing
304 students to fail, and reflect.

305 **4 Methods**

306 The research used qualitative evaluation of students' responses to questions where students were asked to reflect
307 on their learning following a similar methodology to Engel et al., (2022). The study was reviewed and approved
308 by the university's human research ethics committee (Ref: 2021/116).

309 **4.1 Data sources.**

310 We used three different data sources to complete the qualitative evaluation. The first is a student reflection that
311 students completed towards the end of the course. The second data source are focus group interviews that were
312 completed after each course. The third data source are student artifacts from the online part of the course.

313 In both 2021 and 2022, at the beginning of the final laboratory session of the course, students were asked to
314 complete four reflection questions related to their learning in the course. All students were asked to complete this
315 questionnaire as part of their normal coursework. 21 students agreed to participate in the research (and thus share
316 their reflections) in 2021 and 27 students agreed in 2022. This research uses two of these questions as data sources:

317 Q1. What did you learn in this course and why is it important to you and/or your potential career? Q2. Has this
318 course influenced your bicultural competence? (Table 4)

319 The timing of the questionnaire was immediately after the course content, although before most students had
320 completed their projects. This offered the students a tangible and immediate opportunity on which to reflect on
321 whether the course had achieved its intended learning goals. The reflective questionnaire served both as a means
322 for students to consolidate their learning and as a data source for our research questions. Reflective questionnaires
323 and journals are a common method in STEM education research (Boyle et al., 2007; Scott et al., 2019; Treibergs
324 et al., 2022). The first question offered an open-ended opportunity for students to think about what they learnt
325 without being prompted towards thinking about learning goals or specific skills. The second question was targeted
326 towards the specific learning objective of bicultural competence which aligns with a university wide graduate
327 attribute.

328 Focus groups were held after the last week of class both years. The focus group interviewer asked several questions
329 related to the course changes (Supplemental A). The main questions relevant to this research was:

- 330 • How has the course affected the way you feel/think about your bicultural competence and confidence?
- 331 • How has the course affected the way you feel/think about your science communication skills?

332 The focus groups were run after the course had ended but before the final exam or project was completed. 10
333 students participated in 3 focus groups in 2021 and 7 participated in 2 focus groups in 2022.

334 We also used student artifacts from to courses as a source of data. In 2022, at the end of each module students
335 were asked to rate how confident they were to achieving learning goals and justify their responses. These
336 responses, as well as other responses to open ended discussion questions throughout the course, were additionally
337 analysed to explore whether specific part of the course led to perceived improvements in achieving the learning
338 goals relating to communication skills or bicultural competence. 6 end of module questions and 11 discussion
339 questions were analysed.

340 **4.2 Data Analysis method**

341 **4.2.1 Reflection questionnaire**

342 Students' reflection responses were coded by breaking down the two questions into sub-questions to help analysis
343 (Table 4). Each questionnaire was then coded according to these sub questions using coding categories. For
344 example, Question 1 of the questionnaire was simplified down three sub questions "What was learnt?", "Is what
345 you learnt important to your future career?", and "Is what you learnt important to you personally?" (Table 4).
346 Student responses to these questions underwent a first order coding content knowledge, skills or attitudes.

347 An example of how an answer is coded is shown in a response to Question 1 from the questionnaire below.

348 *"This section of the course has taught me heaps! I loved learning more about the different*
349 *types of volcanic eruptions, how they form, and the hazards associated with different*
350 *eruptions. I can see how understanding these fundamental concepts will be valuable going*
351 *forth into a geologist career. As well as learning about geology, this course also*
352 *strengthened my ability to be curious and excited about things and ask questions. It was*
353 *very eye-opening hearing Ben's reflection of the Whakaari disaster, as before hearing his*

354 *perspective I had never considered this implication between science research and human*
355 *safety of a tourist destination.”*

356 In this quote, the student stated that they have learnt about content knowledge including different types of volcanic
357 eruptions, how they form, and the hazards associated with different eruptions. They also mention that the course
358 gave them an understanding of fundamental concepts that would be valuable for a geology career. Lastly, they
359 state that the course helped strengthen their curiosity and gave them excitement to ask questions. It also changed
360 their perspective on science research and human safety at a tourist destination such as Whakaari. This answer was
361 marked as a student having gained knowledge of a factoid and changing their attitudes towards learning and
362 thinking. This student did not mention anything about skills gained. This method was utilised for both questions
363 in the questionnaire across all years of this study.

364 **4.2.2 Focus Groups and Discussion boards**

365 Focus groups were recorded and then transcribed. The questions asked during the focus group were formulated to
366 supplement the questions asked in the reflective questionnaires. These questions and their equivalent in the
367 reflective questionnaires are presented in Table 5. The discussion board data was analysed to track if a comment
368 related to biculturalism or science communication. Both the focus group and discussion board data are used to
369 supplement the data from the reflective questionnaires to clarify and drill deeper into the meaning of the data.

370 **5 Results**

371 We report course reflections on learning in 2021, and 2022, relating to learning skills, and specifically code our
372 analysis for bicultural competence and science communication. We also present focus group discussions and
373 specific student reflections within the course that related to either bicultural confidence, science communication
374 or specific pedagogies, activities, or course elements.

375 **5.1 Overall learning**

376 The analysis of student reflections of Q1. *What did you learn in this course, and why is it important to you and/or*
377 *your potential career?”* showed that from 2021 to 2022 there was an increase of 13% of comments on learning
378 that related to skills when compared to learning content or general attitudes (Fig. 3, Table 4). When these skills
379 were categorized by types of skills, students in 2021 were more likely to mention skills relating to data, or other
380 skills such as microscope skills, whereas in 2022 students specifically mentioned bicultural competence and
381 communication, as well as flexible learning skills (Fig. 4).

382 In 2021 students were more likely to mention content knowledge and other skills relating to the laboratories, for
383 example,

384 *“I learnt different aspects of volcanology and magmas, this is crucial in understanding*
385 *volcanic environments and deposits as well as using microscopes to identify different*
386 *minerals in thin section and understand how this can relate to magmatic environments.*
387 *This could be applied to many careers outside of volcanology, the skills taught in this*
388 *course are essential for any geologist.”*

389 The student mentions that they learnt about different magmas (content knowledge) and using microscopes (Skills).
390 They also address the second part of the question and mention that the skills learnt in the course are applicable to
391 many careers outside geology and are essential for any geologists. Other students' responses focused on content
392 knowledge and several students did not mention any benefits to their future career, e.g.:

393 *“The effects of a volcano on the surrounding area in the form of ash and bombs etc.*
394 *different types of magmatic flows and what moves them such as gas content and if they're*
395 *mainly juvenile etc.”*

396 **5.2 The learning environment**

397 Although the reflection question focused on *what* was learnt, many students mentioned *how* they learnt, and this
398 was coded as a skill in both years analysis. Particularly, the freedom to work at their own pace was commonly
399 mentioned in the reflection exercise:

400 *Helps me be able to go at my own pace, and not having to sit in one spot and watch a 50*
401 *minute straight lecture which is very boring and mentally draining.*

402 *The online modules were a very different way of learning than I was used to, and I think I*
403 *can take lessons of time management, persistence and quizzing from it. I think that my time*
404 *management started poor, but found that when I was able to push through the temptation*
405 *for distraction...I also liked how the online work quizzed me after introducing a topic, and*
406 *I think that this is conducive to my learning*

407 *The modules allowed me to work at my own pace and better understand the material as I*
408 *could go back and re-watch videos or re-attempt an answer if I got it wrong, which helped*
409 *me figure out what I needed to focus on more within the modules and my learning.*

410 *Allowing us to re-attempt the questions and self reflect/mark showed that I learn from*
411 *making mistakes and emerging myself within a topic more which was helpful.*

412 *I have enjoyed the small quiz questions directly underneath the content that introduces*
413 *what the questions will be about, it keeps the knowledge fresh for the questions.*

414 This flexible blended learning environment was seen as a positive development, especially the ability to work at
415 their own pace. Some students identified their own growth in time management skills. The frequent quiz questions
416 associated with content is also mentioned positively several times.

417

418 Overall, after the intervention students identified communication and bicultural competence skills, as well as
419 flexible learning more often in their reflections, with less mention of content knowledge and attitudes.

420 **5.3 Specific aspects of the course linked to learning by students**

421 Student specifically regularly mentioned exercises in a positive manner. Student appreciated the models and maps
422 that were part of the course as per some student reflections (this is consistent with previous studies Watson et al.,
423 (2023):

424 *The online lectures really helped with outcrop descriptions and 3D visualisation. the use*
425 *of models and maps in this course was AMAZING, and I really found they helped my*
426 *understanding of the larger scale geological processes which the course was trying to*
427 *teach us.*

428 Students mentioned the specific assessment exercises, e.g in the reflection at the end of a module, this student
429 mentioned an open answer question that was asked in that module:

430 *It also was directly linked to what we were learning about like with the geothermal*
431 *resource email to the Maori land owner, rather than randomly being brought in every now*
432 *and then unrelated to what was goin on...I also like that there were Maori experts in their*
433 *fields who were directly teaching some of the concepts, that was great.*

434 In the focus groups, students mentioned that they appreciated the guided method used to teach skills through
435 applied exercises:

436 *I think those sorts of yeah[exercises], like none of my other courses have really touched on*
437 *that and having that like guided approach through it and like I think it's definitely a cool*
438 *skill that I have like obtained um, cos it's not just yeah, like rote learnt knowledge*

439 Practicing the procedure in different contexts and with different target audiences was seen as a beneficial, helping
440 cement concepts, according to this quote from a focus group participant:

441 *“Um, maybe just adding to, I think having the multiple different tasks, like with concepts,*
442 *so you constantly had to think about the science side and the like, bicultural perspective*
443 *but in different formats a Facebook post which is, you know super, .. and then you had*
444 *one where it was like an email where you sort of had to be like, okay this is a different*
445 *format but the same thing and then talking to little kids, you're not going to use the same*
446 *words, same terminology, the same approaches to all of those things.”*

447 **5.4 Communication skills**

448 In 2022 students typically mentioned communication skills which was coded as either general communication
449 skills or part of bicultural competence in the case of specific bicultural communication.

450 *“The biggest thing I learnt in this course way how to communicate scientific ideas to a*
451 *non-scientific community in a way that helps them understand the ideas without creating*
452 *distress or make them feel that their culture is not heard and appreciated. This is a skill*
453 *that I will use within my future career when dealing with any people, both coworkers and*
454 *people within the public.”*

455 *“This idea of respectful communication is something that would be important wherever I*
456 *go, and is something that I hope to be able to practice in the future.”*

457

458 These are typical examples of student responses in 2022. The student mentions that they learnt how to
459 communicate (Science communication). They also mention culture (Bicultural skills). They do not mention any

460 content knowledge, however they do acknowledge that the communication and cultural skills they gained will be
461 important in their future career. Some students did not link their skills learnt to their future career but did mention
462 content knowledge and the importance of bicultural communication.

463 *“I learned a lot about Nz and Iceland volcanoes and how they compare to each other. I*
464 *also learned about some mitigation strategies and how to categorise different types of*
465 *volcanic eruptions. I also learned a new way of learning online through these videos and*
466 *answering the questions as I go through. I learned about incorporating Maori knowledge*
467 *and the importance of Maori involvement with geothermal projects.”*

468 Student’s reflections at the end of module also mentioned the same sentiment. In the next three quotes, students
469 discuss the value of an exercise where students were asked to comment on the following fictional social media
470 post: **“I have heard volcanoes erupt after earthquakes and I know Lyttleton volcano has had an explosive**
471 **history, I also read in the news that there are some hot springs that have got hotter since the earthquake, I**
472 **am not sure if I could cope with lava on top of everything- does anyone know if the volcano will erupt.**
473 **Posted by John B”:**

474 *“I thought this was a very relevant module that taught me skills that I will definitely use. I*
475 *quite often see misinformation or posts similar to John’s, and I usually avoid them because*
476 *I don’t know how to approach them. This module gave me the skills to do so.”*

477 *“I found this module rather enjoyable, a lot of the time social media can provide a lot*
478 *misleading information that can generate unwanted fear in people or provide incorrect*
479 *information to people that can then be passed on. To be able to politely critique a member*
480 *of the general public and guide them towards more reliable scientific information.”*

481 *“I enjoyed this module as I have seen posts on social media that were not well*
482 *communicated, so learning better ways to communicate was nice to see.”*

483 These reflections show that the students felt the exercises were authentic and relevant to their learning journey.

484 **5.5 Bicultural Competence and Confidence**

485 The reflection question *“Has this course influenced your bicultural competence?”* (Fig. 5) showed that in 2021,
486 only 43% of students thought their confidence was influenced, in 2022 this number increased to 93%. When the
487 student answers were coded to explore their answers, it was apparent bicultural competence in 2021 was
488 interpreted as also knowing Icelandic experience with volcanoes by many students (Fig. 6), which isn’t a surprise
489 given that most of the virtual fieldtrip in 2021 was set in Iceland and featured Icelandic locals and narratives. This
490 is illustrated by the quote from a student reflection response:

491 *“I think the Iceland trip perhaps enhanced my bicultural knowledge on how other*
492 *communities deal with volcanic hazards.”*

493

494 A typical student response from 2022 was:

495 *“This course has definitely influenced my bicultural competence. I have gained a better*
496 *understanding of Maori and Icelandic cultures and the importance of being culturally*
497 *sensitive when communicating information.”*

498 *“Absolutely, this is the course that has gone most into it. In a lot of other courses I feel as*
499 *though it is only really mentioned at the start maybe fore a mihi and then is forgotten*
500 *about has the course goes on, but here it was brough through out the whole course which*
501 *was cool. It also was directly linked to what we were learning about like with the*
502 *geothermal resource email to the Maori land owner, rather than randomly being brought*
503 *in every now and then unrelated to what was goin on...I also like that there were Maori*
504 *experts in their fields who were directly teaching some of the concepts, that was great.”*

505

506 The focus group transcriptions and discussion board responses also revealed the value that the course contributed
507 to the student’s bicultural confidence (Table 5). One example from a focus group discussion:

508 *“Yeah, I think the communication side of it was probably the most beneficial that I got out*
509 *of the course, um, especially yeah I suppose interacting with like manu whenua Māori and*
510 *um, and even just how to, I suppose adapt your communication to particular audiences”*

511

512 *“I feel like this part of the course has been very inclusive of what is the indigenous*
513 *approach to this, what is the cultural understanding, how can we incorporate the sort of*
514 *more indigenous aspects into how we approach science sort of like with the braided rivers*
515 *approach.”*

516 In this quote, the student shows a new appreciation for adapting their messaging to different cultures.

517 The following quotes from focus groups interviews in 2022 show that students value bicultural confidence and
518 competence skills:

519 *“...especially in New Zealand, it’s so important to incorporate that indigenous knowledge*
520 *when it comes to how we approach science”*

521

522 *“I feel like this part of the course has been very inclusive of what is the indigenous*
523 *approach to this, what is the cultural understanding, how can we incorporate the sort of*
524 *more indigenous aspects into how we approach science sort of like with the braided rivers*
525 *approach...”*

526

527 *I think it is a good reminder that a bicultural approach is necessary, especially within the*
528 *work place. I really liked how Ben used the karakea, as I felt it tied the course up nicely,*
529 *beginning to end.*

530

531 Students were very interested in the actual content and expressed that they would like to get a deeper
532 understanding of the subject, for example these discussion board quotes:

533 *I found the Māori volcanology legends fascinating and I would love to learn more about*
534 *how they view volcanoes and how we can use a mixture of both Western and Māori*
535 *knowledge to inform hazards and risks.*

536

537 *Learning about the volcano family, particularly in the context of Maori mythology is an*
538 *interesting idea that we often don't get to experience as science majors. Very cool!*

539

540 *I also enjoyed the input from Dan, on the ways we can implement maori/ native cultural*
541 *information, as you currently don't see a large amount of scientific literature with*
542 *consideration of these kind of inputs.*

543

544 **6 Limitations**

545 The research and the course assessment were intertwined, for example the instructor was also one of the
546 researchers, and part of the assessment (the reflections and discussion boards) were used as research artifacts.
547 However, marks for reflections and discussion boards were only for completion, and the student answers were
548 anonymized before the instructor saw them (e.g. Watson, 2022) as per ethics agreement. Similarly, when the
549 research was presented to the students and their participation in the research was requested, the instructor was out
550 of the room as per ethics agreement. However, considering that the research relies on the students' perception of
551 their learning, it is possible that students' perception of what they were learning was influenced by the research.
552 Given that this study is a comparison between two years, and both years the research methodology was identical,
553 comparisons between both cohorts should be uninfluenced by the research.

554 **7 Discussion**

555 By comparing the results from the two separate classes, we can get some insight into the effect of the course
556 changes. The analysis shows that students in the post-intervention group were more likely to mention skills in
557 their reflections on what they learnt (Fig. 3). When analysed further, the skills that were mentioned were most
558 likely to be relating to communication, online environment, and bicultural competence. This increase in
559 mentioning skills aligns with the instructors' goals for the changes implemented in the course, which were
560 specifically to improve the communication skills and bicultural confidence of the students, (Fig. 4).

561 Overall, the student reflections show that the change from a lecture-based classroom setting to a flipped classroom
562 with an interactive, engaging, and pedagogically grounded online environment was an effective classroom
563 intervention. The 2022 iteration contained more interactive elements and functionality aligned to communication
564 and bicultural competence. It provided more authentic assessment and opportunities for deliberate practice (e.g.
565 Benjamin & Tullis, [2010](#)), which are pedagogical approaches that are linked to improved learning. The delivery

566 of both 2021 and 2022 content was during the COVID pandemic although neither were affected directly by
567 lockdowns, the reflection questions analysed here did not address the impact of COVID pandemic on learning,
568 although this context is important to consider as has been shown to influence students and instructors' opinions
569 of online learning (Chakraborty et al. 2021).

570 The intervention contained additional exercises to encourage students to engage with class material outside of the
571 classroom and apply what they learned to real world situations that they expect to experience in a future career.
572 These exercises can be defined as authentic assessments (Kaider et al. 2024). Students linked these authentic
573 assessments with their perceived learning in the discussion boards, reflective posts, or focus groups where students
574 reflected on specific exercises linking these exercises to learning specific career useful skills. Students quotes
575 showed that they felt that the course provided them with opportunities to practice skills to communicate
576 effectively. They felt that these authentic assessment exercises could help them develop skills that could be useful
577 in future careers. Some quotes reveal that these skills were something that the students had already encountered
578 in their personal lives and therefore valued as authentic. These skills are not only related to the courses' learning
579 goals, and also can be linked to UC's BSc graduate attributes of "Biculturally competent and confident" and
580 "Employable" specifically around "Communication". Although not directly related to a specific geology career,
581 they are, in essence, skills required to become an informed BSc graduate and citizen.

582 A clear change between both cohorts is the bicultural confidence context that students mentioned in their
583 reflections. In the 2021 cohort, most of the group discussed Icelandic culture when asked about bicultural
584 confidence and competence, however almost all students took it to mean Māori culture in the 2022. Although this
585 in not the case overseas (e.g Clark ,2006), in New Zealand, biculturalism specifically refers to the existence of
586 two distinct cultures, Māori culture and New Zealand culture, based primarily on values from British settlers
587 (Eketone, & Walker, 2015). This latter definition of biculturalism is relevant here and when interpreting students'
588 responses regarding bicultural confidence and competence in the reflective questionnaire in both years. That
589 students mentioned Māori culture less in 2021 is likely related to the lack of Māori experts and assessments
590 relating to bicultural confidence featured the 2021 version of the course, and therefore the students might have
591 felt that bicultural confidence in the context of the course did not specifically relate to Māori culture. The 2022
592 data shows that bicultural understanding was at least partially shifted and was related to the Māori experts featured
593 in the course and the related assessments. Improved cultural competency has been reported to enhances people's
594 well-being by bringing together indigenous and nonindigenous knowledge and practices (Eketone & Walker,
595 2015).

596 Students quotes overall showed a genuine appreciation for the Mātauranga Māori and bicultural content.
597 Reflections showed that the content in the 2022 version of the course felt authentic and better integrated in the
598 course compared to other courses. Students appreciated that the instructor lead by example by adhering to Māori
599 tikanga (customary practices) while delivering the course. Our model of MOOC, flipped classroom and focus on
600 developing lecturer-student and peer relationships is an expression of Māori tikanga, and enabled students to
601 experience it through undertaking the course. For example, students experienced whanaungatanga (meaning
602 "creating cohort connection through relationship building" in this context) through the intentional relationship
603 building, and further by writing and sharing their pepeha, reading other students' pepeha, an activity that the
604 students highlighted in their reflections. Students also commented that they appreciated videos shared by our

605 cultural experts, where cultural values were frequently expressed such as kaitiakitanga (intergenerational
606 sustainable guardianship of the land) around the geothermal industry.

607 **8 Conclusions**

608 Our research describes the pedagogy behind our course and the critical roles that all the members of the team had
609 in course development. We then present and discuss data on students' perceptions of their learning and how this
610 relates to elements of the course.

611 Learning advisors guided us to produce engaging interactive activities on the edX online platform, these were
612 critical in allowing creation of activities that enabled deliberate practice of skills in a variety of assessment types.
613 Similarly, our cultural advisors who also delivered authentic content, providing essential mana and expertise in
614 cultural knowledge and how to design assessments that reflect and test this knowledge. These roles were essential
615 to achieve the learning associated with skills-based learning objectives in 2022, and this was in addition to the
616 critical roles of the instructor and 3D visualisation tools developer as discussed in Watson et al. (2022;2023)

617 Students in 2022 were more likely to mention communication skills, bicultural skills, or skills relating to flexible
618 learning when asked to reflect on their learning. Several students in 2022 specifically mentioned the newly
619 introduced authentic assessments and linking this to their skill learning. Some students also mentioned the
620 opportunity to practice skills in a variety of contexts and tools.

621 The team-based development of the flexible course, with multiple experts and repurposing of videos should
622 provide a template for the development of other courses with skills-based course learning goals. In addition, the
623 research supports the use of multiple flexible modes of authentic assessment to promote skills-based learning.

624 In summary, students' reflections showed that during the course they gained bicultural confidence and
625 communication skills. Our consideration of Māori tikanga, Mātauranga (knowledge) and values such as
626 kaitiakitanga (guardianship) and whanaungatanga (relationships) alongside scientific methods fostered the ability
627 to communicate science with a range of people with different academic and cultural backgrounds, which is
628 important in most careers in Aotearoa NZ and globally. We encourage other academics to uphold local indigenous
629 cultural perspectives when developing and delivering science courses.

630 **Foot notes**

631 ¹Although Aotearoa is a Māori name for New Zealand's North Island, to reflect the nations bicultural foundation
632 it is commonly and increasingly used in this way, e.g., Aotearoa New Zealand, or simply Aotearoa NZ, to mean
633 New Zealand.

634 **Author contribution:**

635 BK and JD designed the experiments and JD and KE carried them out. All Authors contributed to the design and
636 re-development of the course. BK prepared the manuscript with contributions from all co-authors.

637 **Competing interests:**

638 The authors declare that they have no conflict of interest.

639 **Ethical statement**

640 The study was reviewed and approved by the University of Canterbury's human research ethics committee (Ref:
641 2021/116).

642 **Acknowledgements**

643 We would like to acknowledge the contributions of Abby Susko as Kaiarahi Māori for the faculty of science in
644 helping design of bicultural assessments and general tikanga. We would also like to acknowledge Kelvin Tapuke
645 and Bubs Smith for their cultural guidance throughout the project. We also would like to thank Rob Stowell for
646 his tireless help with video recording and scripting. We would also like to thank [Mathew Stiller-Reeve](#), Siri Veland
647 and one anonymous reviewer for providing invaluable feedback on this manuscript. Funding was provided for
648 Kennedy through Ministry of Business Innovation and Employment, Endeavour project Beneath the Waves.

842 **Tables**

Course run	Implementation and assessment	Research data
2021	10hrs lectures with assessed in class exercises 15hrs laboratory work assessed workbook 4hrs online VTF and assessed online discussion boards 2 hrs Workshop in last 2 weeks of course: Study for exam and 2.5 hr final exam	End of course reflection Focus groups
2022	12hrs online MOOC VTF online exercises 15hrs laboratory work and assessed workbook 5hrs flipped workshops and assessed workbook: Science communication project	End of course reflection Weekly reflections Focus groups

843 **Table 1: Course structure and research data from both runs of the course**

844

2021	Informal discussion with group (10 min) Handout with applied interpretative sketches and reflections. (35 min)
2022	Highlighting exemplar online responses from students(5min) Reflection on confidence of achieving learning goals as guidance for workshop (5min) Warm up question as mental ramp up(5min) Mini interactive lecture based on content with low confidence (10min) Two group workbook questions, designed to explore content and develop communication skills (20min)

845 **Table 2: Workshop structure comparison from both runs of the course**

846

847

Online content	Video	Multichoice	Discussion boards	Interactive	End of module
VFT (2021, last two weeks)	Instructor, and Iceland experts	Content focussed	Prior knowledge, Reflection, Sketching skills	3D rocks, 360 video, 3D landscapes	Applied question (+one module with reflection)
MOOC (2022, every week)	Instructor, Indigenous leaders and scientists Iceland and NZ experts	Content and skill focussed	Prior knowledge Reflection Sketching skills Communication skills	3D rocks, 360 video, 3D landscapes Mapping with communication and cultural elements	Reflection after specific goals achievement exercise.

848 **Table 3: Details of online content.**

Reflection Questions	Question aspects	Coding categories	Results	
			2021 (Total n = 21)	2022 (Total n = 27)
Q1. What did you learn in this course and why is it important to you and/or your potential career?	What was learnt?	Content knowledge (Factoids)	21	23
		Skills, 2021	18	26
		Attitudes	11	4
	Is what you learnt important to your future study/career/personally?	Yes	17	21
		No	1	0
		Not Stated	3	4
Q2. Has this course influenced your bicultural competence (BCC)?	Did the course improve your BCC?	Yes	9	25
		No	8	1
		Unsure	3	1
		Not stated	1	0
	What kind of cultural knowledge was improved?	Māori	5	17
		Icelandic	8	1
		Other	1	7
		Not stated	12	2

849
850 **Table 4. Coding methodology. The numbers reported in the columns are the number of students that mentioned the category in their reflections. n is the total number of answer.**

Focus Group Questions	Reflective Questionnaire Equivalent
How has the course affected/influenced/helped/assisted your learning in volcanology/geology?	Q1. What was learnt? (Facts/Attitudes)
How has the course affected the way you feel/think about your science communication skills?	Q1. What was learnt? (Skills)
How might your experience with the course help you in the future?	Q1. Is what you learnt important to your future study/career/personally?
How has the course affected the way you feel/think about your bicultural competence and confidence?	Q2. Has this course influenced your

	bicultural competence (BCC)?
--	---------------------------------

851 **Table 5. Focus group questions mapped onto the reflective questionnaire questions**

852

853

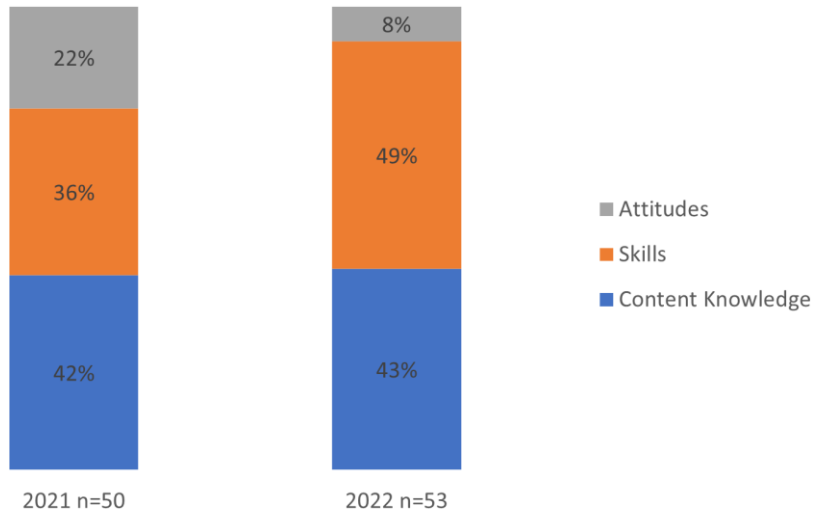

855
856 **Figure 1. An example of two pages of a student communication project aimed at educating children about**
857 **hazards from gases in the city of Goma in the Democratic Republic of Congo.**
858

Goals reflection

	Very confident	Fairly confident	Not so confident
Locate Krafla in the context of the volcanism and tectonism of Iceland.	65%	31%	4%
Record systematic and detailed observations of an outcrop and a rock of a typical obsidian subglacial eruption.	46%	46%	8%
Record and compare systematic and detailed observations of the map-scale geology and geomorphology of tuff cones, lava domes and/or caldera volcanoes.	42%	54%	4%
Use rocks to communicate your understanding of volcanic processes and products to a diverse group of primary school	50%	38%	12%

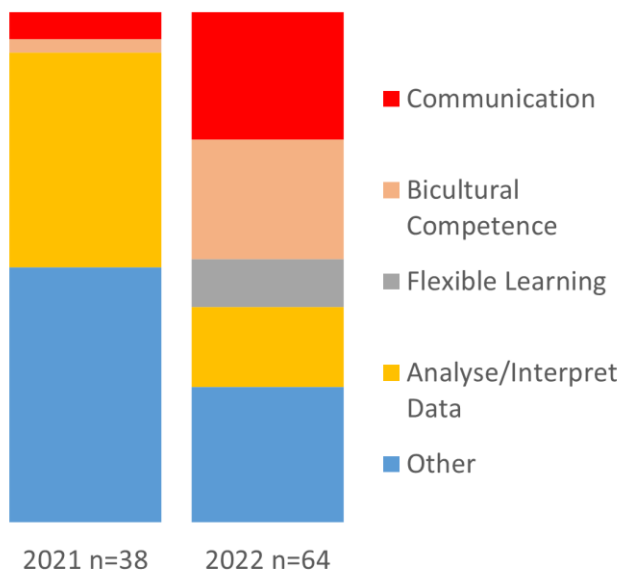

- I personally had real trouble looking at the outcrops as I feel like the quality wasn't ideal. I knew it was a dyke and it's structure, but it was difficult to make all the observations correctly even when I was looking really hard and trying my best. I really enjoyed the hazard exercise, as explaining the rocks to children really cemented that I knew the difference and could explain it in a simple way. I also didn't know there was such a thing called a rootless volcano, so that was super interesting to learn! I enjoyed having the exercise to identify them too as it made it a bit clearer what they looked like.

859
860
861 **Figure 2. Example slide from the start of a workshop session in 2022, showing learning goals, a summary**
862 **of student self -reported confidence on learning goals for the module, and one example justification from**
863 **students. This slide shows how learning goals are constructively aligned by giving students the opportunity**
864 **to self-report and reflect on their achievement of the goals.**
