10 **1 Supporting Information**

1.1 Software

- Research Software in this study was developed using Python (version 3.8) and R (version 4.2.3) language.
- Experimental Setup:

RAM: 256 GB

15 CPU: 2 x 16-Core Epyc 7313

- Bidirectional Encoder Representations from Transformers are developed based on Reimers and Gurevych (2019). We develop UMAP dimensionality reduction based on McInnes et al. (2017). To implement Unsupervised clustering HDBSCAN we rely on McInnes et al. (2018). The BERTopic library Grootendorst (2022) facilitated the BERTopic integration, accessible at <https://maartengr.github.io/BERTopic>. The scripts used for the analysis are available at: https://github.com/SWN-group-at-TU-Berlin/SocialMediaNLP_FloodTopics.
- 20 – Tweet location identification is based on an algorithm developed by de Bruijn et al. (2017). The dataset of flood related Twitter posts from de Bruijn et al. (2019). The Data is available at <https://www.globalfloodmonitor.org/> upon request.

1.2 Supporting Information on Method Development and Data

1.2.1 Data cleaning

- 25 The tweets containing the following strings were removed prior to modelling, because they indicated that the tweets are not flood related: *flüchtl* – refugee, *asyl* – asyl, *migran* – migration, *ezb – geldflut* – ezbmoneyflood, *fachkräfte – flut* – floodofskilledworkers, *app – flut* – appflood, *pegida* – pegida, *islam* – islam, *nazi* – nazi, *#nowplaying* – #nowplaying, *#sex* – sex, *#arsch* – ass, *#obamacare* – #obamacare

1.2.2 Hyperparameter Tuning

- 30 The HDBSCAN clustering results varies with different hyperparameter settings. We iteratively changed the hyperparameters, since our unsupervised approach does not allow for automatic hyperparameter optimization. Limiting the number of clusters to a small number causes many different tweets to be aggregated in one big cluster, even though their topics are very diverse. This will result in fuzzy clusters. Too many topics however, will result in topics that revolve around very specific themes that have little relevance in a broader context. Here we allow for very cluster sizes of minimum 20 tweets to capture a wide range
35 of themes. Additional hyperparameter settings are listed below:

- min_samples = None
 - cluster_selection_epsilon = 0.0
 - max_cluster_size = 20
 - metric = ‘euclidean’
- 40 – alpha = 1.0
- p = None
 - algorithm = ‘best’
 - leaf_size = 40

```
- memory = Memory(location = None)  
45 - approx_min_span_tree = True  
     - gen_min_span_tree = False  
     - core_dist_n_jobs = 4  
     - cluster_selection_method = 'eom'  
     - allow_single_cluster = False  
50 - prediction_data = False  
     - match_reference_implementation = False
```

1.2.3 Twitter (X) Users

Among the organizational users, *@hochwasserportal_de*, an account associated with a portal providing information or updates related to floods or high-water events, has the highest frequency of posting with 2344 tweets throughout the entire time series.

55 There were four other regionally focused analogous accounts that posted moderately between 300-400 tweets. Although not being substantial considering the total number of tweets, this shows a discrepancy in posting activity among these entities and private individuals during the observed period. The tweets from these organizations were semantically very similar and therefore they were successfully separated from the tweets of private users with BERTopic.

2 Figures

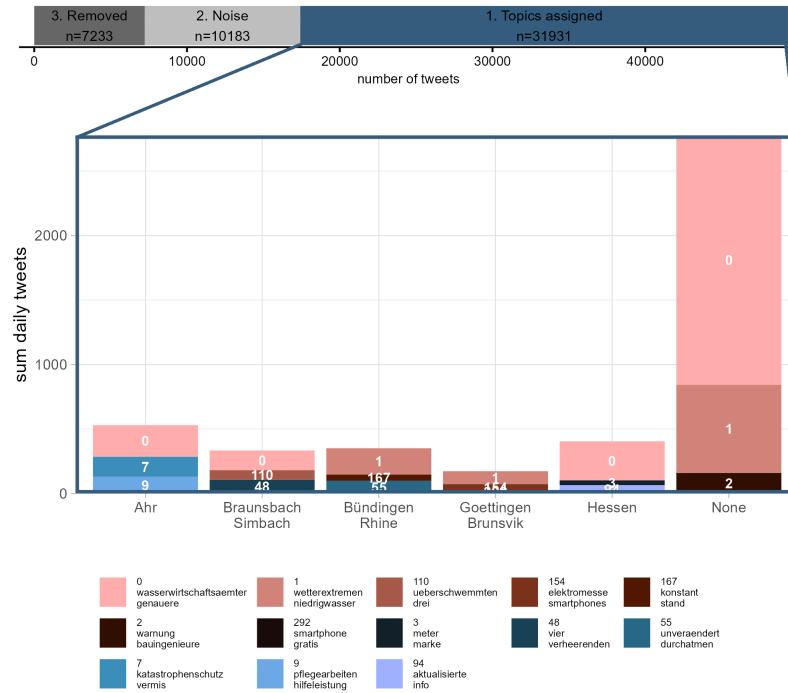

Figure S1. Stacked bar chart showing the three topics representing the highest daily sum of tweets during the event periods. The top chart represents tweets removed by the manual (“Removed”) and automatic (“Noise”) filtering.

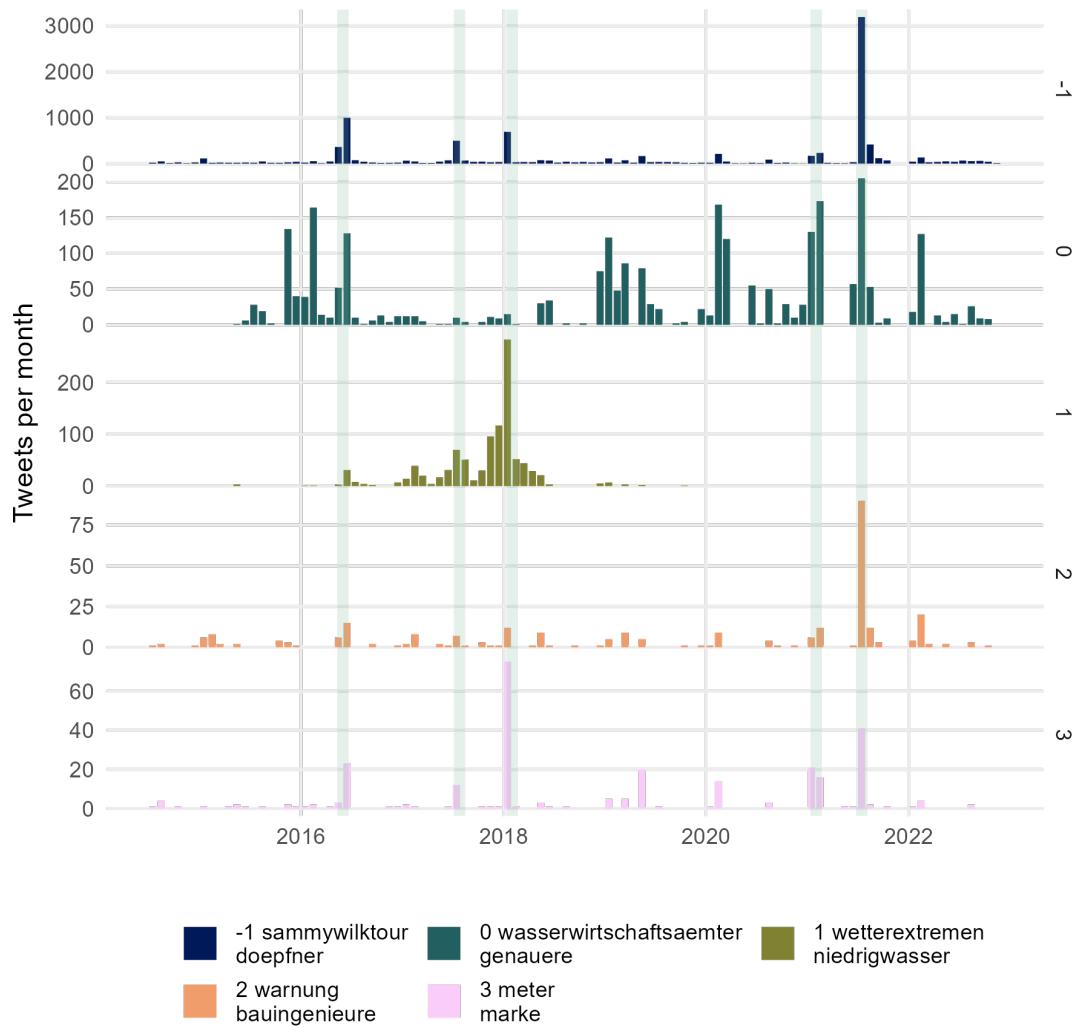

Figure S2. Occurrence of tweets related to the noise topic (top panel, excluded from further analysis) and development of monthly tweets for the four topics with the most occurring instances over the whole time period.

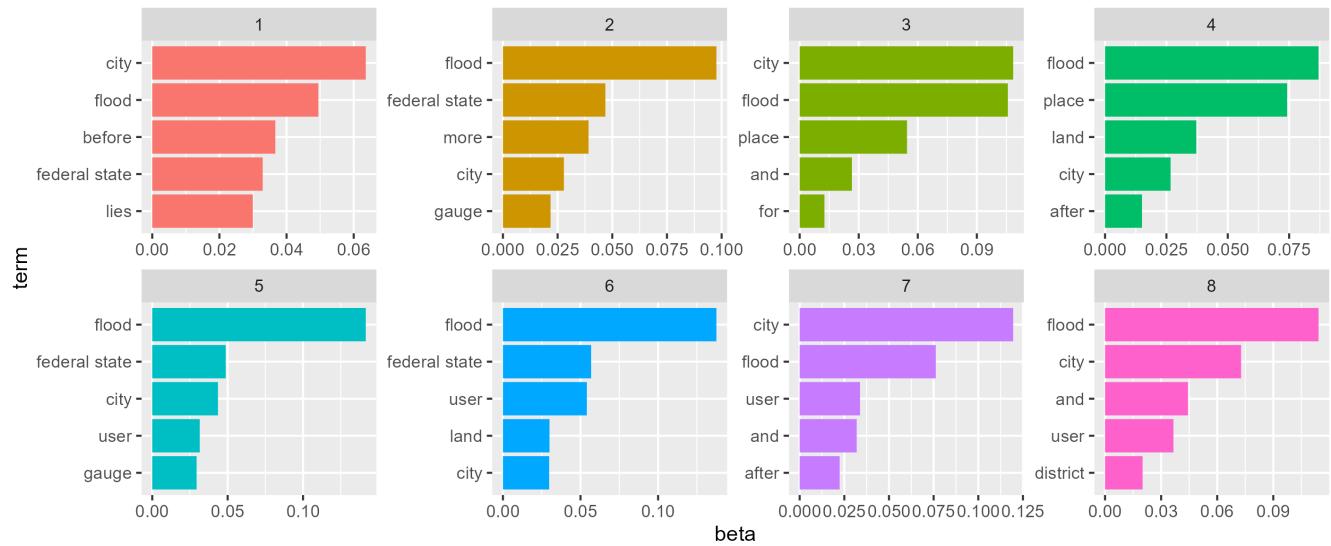

Figure S3. Top terms for 8 LDA topics and beta values.

Table S1: Topic descriptions for all topics represented in Figure 1 in the main manuscript

Topic	Group	Top_n_words	freq	representative text
