Figures

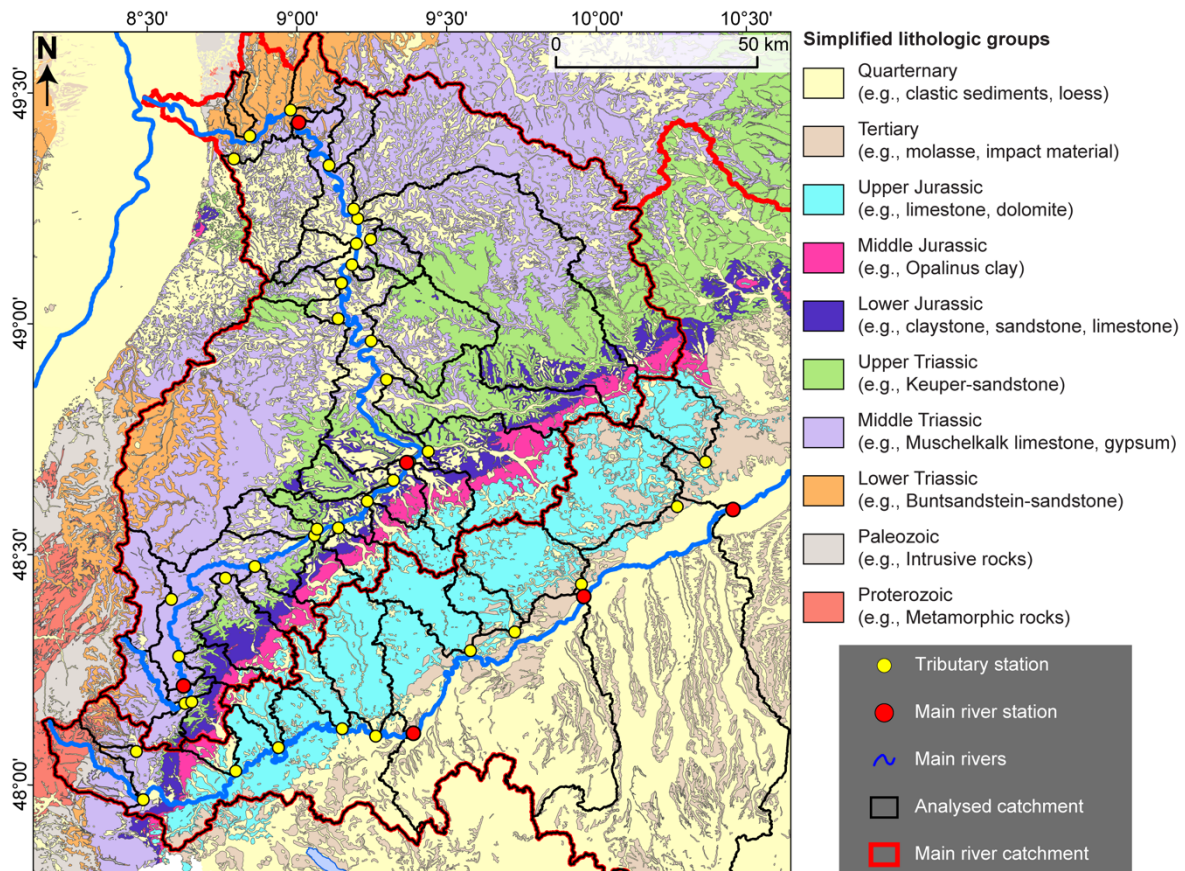

Figure S1 Simplified lithologic map for the investigated catchments around the Swabian Alb escarpment (based on map from Bundesanstalt für Geowissenschaften und Rohstoffe. Geologische Übersichtskarte der Bundesrepublik Deutschland 1:250 000 (GÜK250, WMS), 2019). The points give locations of measurement stations providing data to calculate physical erosion and chemical weathering rates.

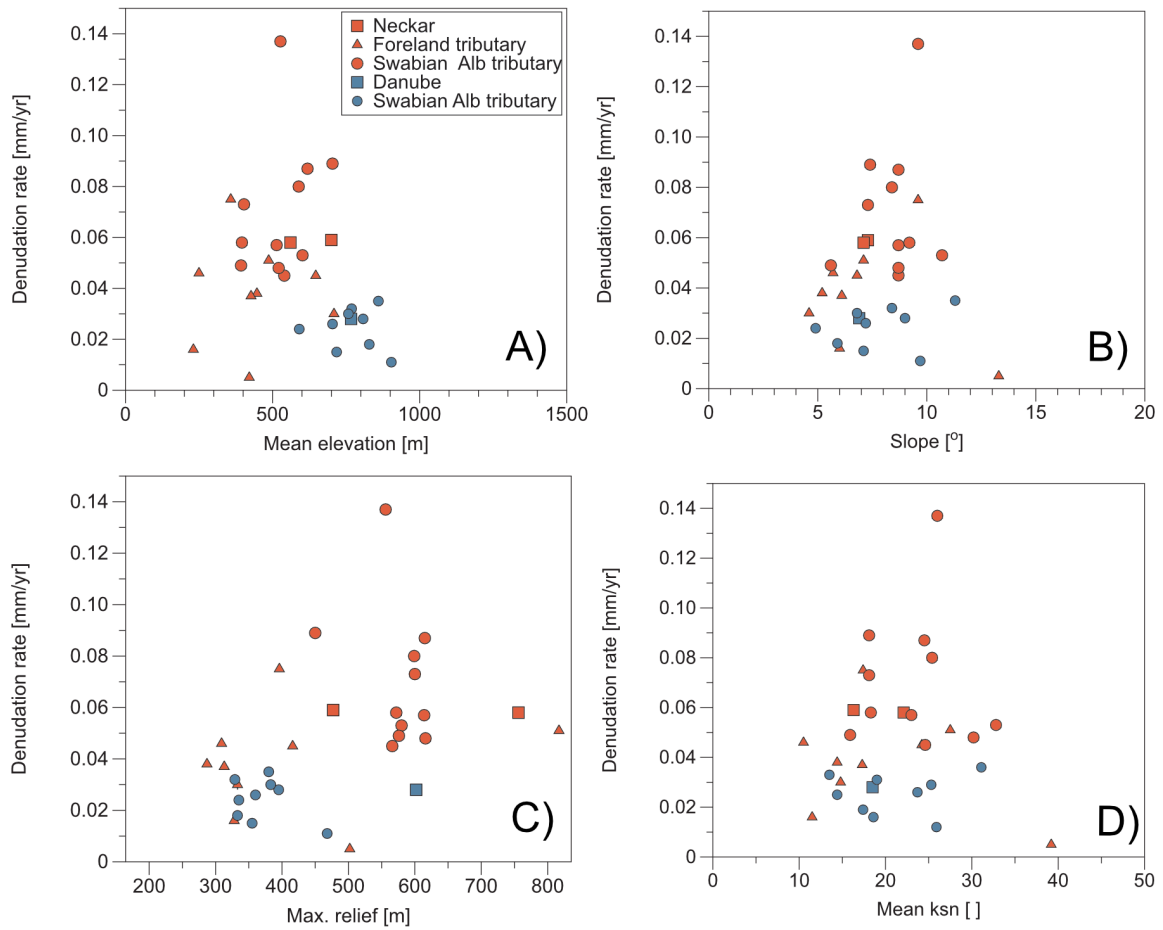

Figure S2: Decadal-scale total denudation rates versus topographic metrics; A) Mean elevation of drainage basin; B) Maximum relief; C) Mean slope; and D) Mean k_{sn} .

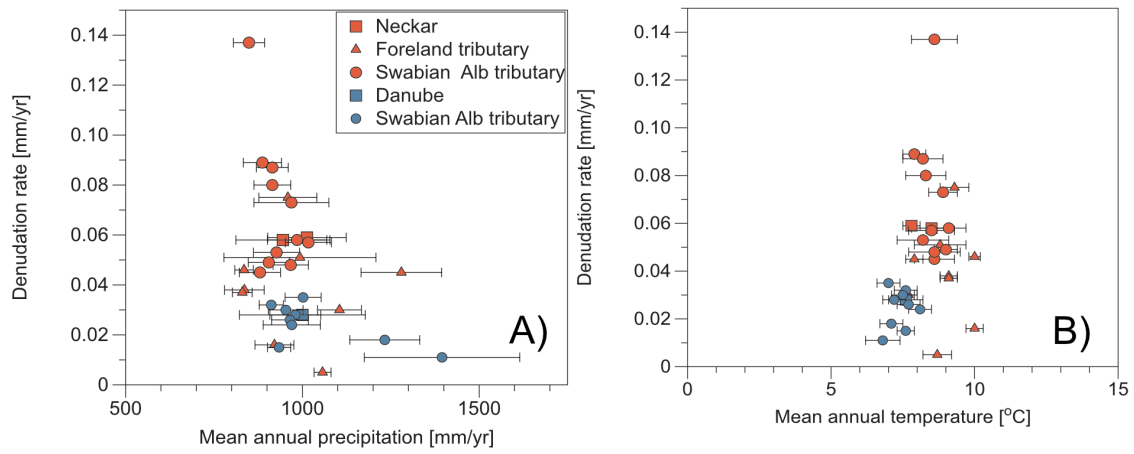

Figure S3: Decadal-scale total denudation rates versus climatic metrics: A) Mean annual precipitation; and B) Mean annual temperature.

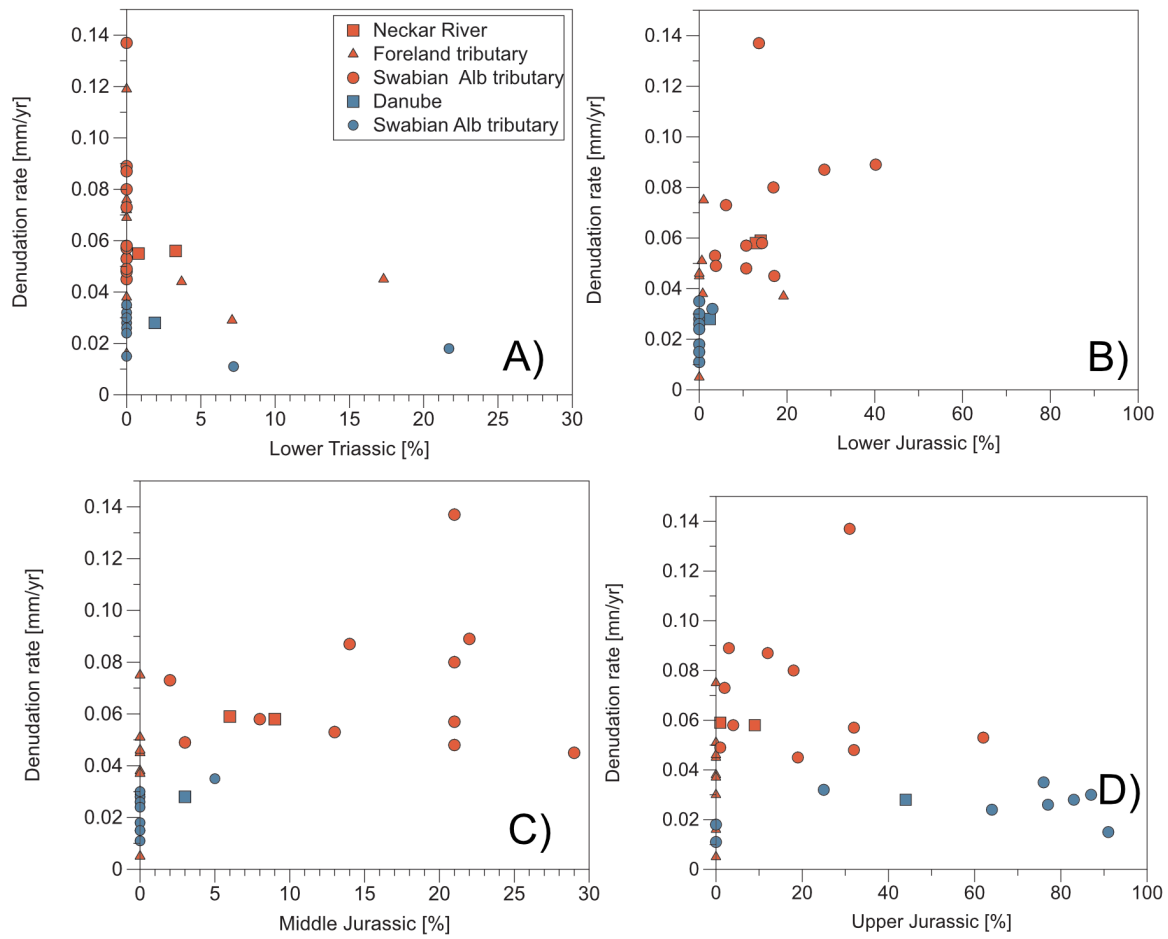

Figure S4: Decadal-scale total denudation rates versus percent exposure of two selected lithologies: A) Lower Trias; B) Lower Jura; C) Middle Jura; and D) Upper Jura.

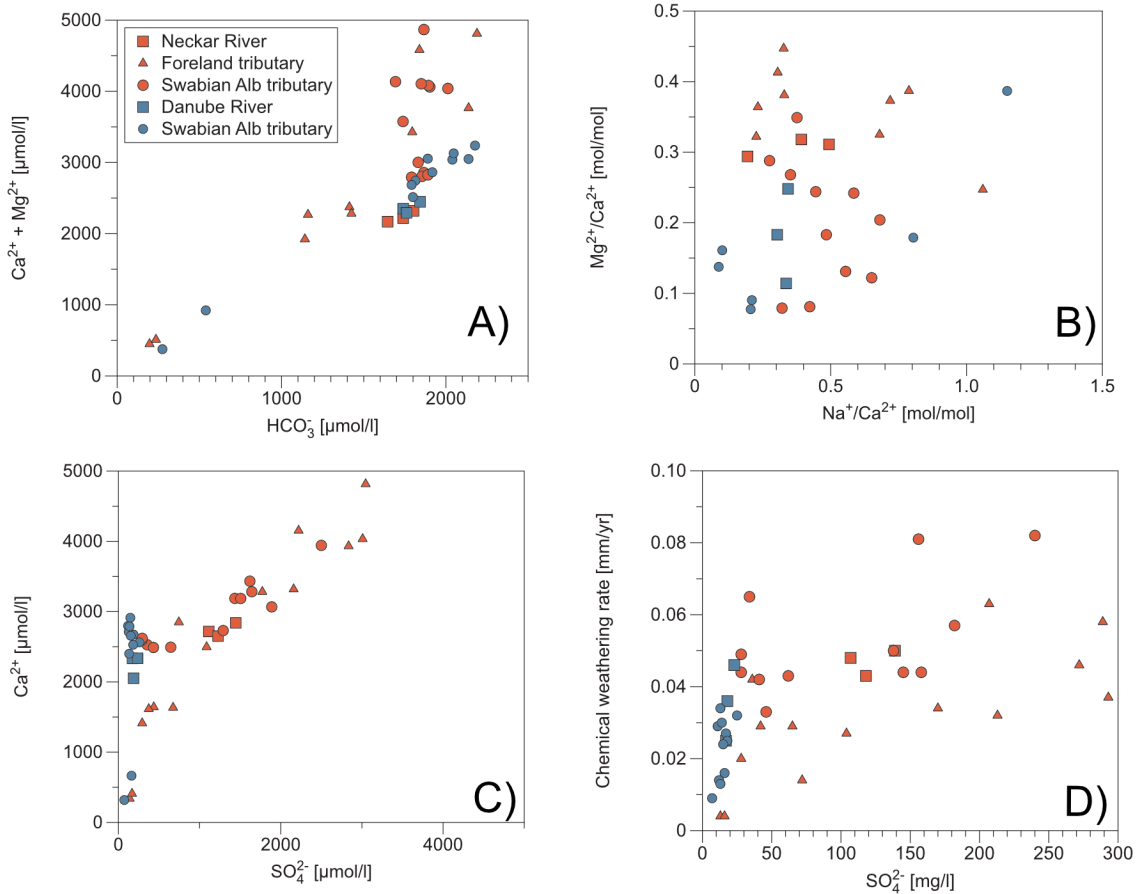

Figure S5: Plots for different chemical parameters: A) Ca^{2+} plus Mg^{2+} versus HCO_3^- ; B) $\text{Mg}^{2+}/\text{Ca}^{2+}$ versus $\text{Na}^+/\text{Ca}^{2+}$; C) Ca^{2+} versus SO_4^{2-} ; D) Chemical weathering rate over SO_4^{2-} .

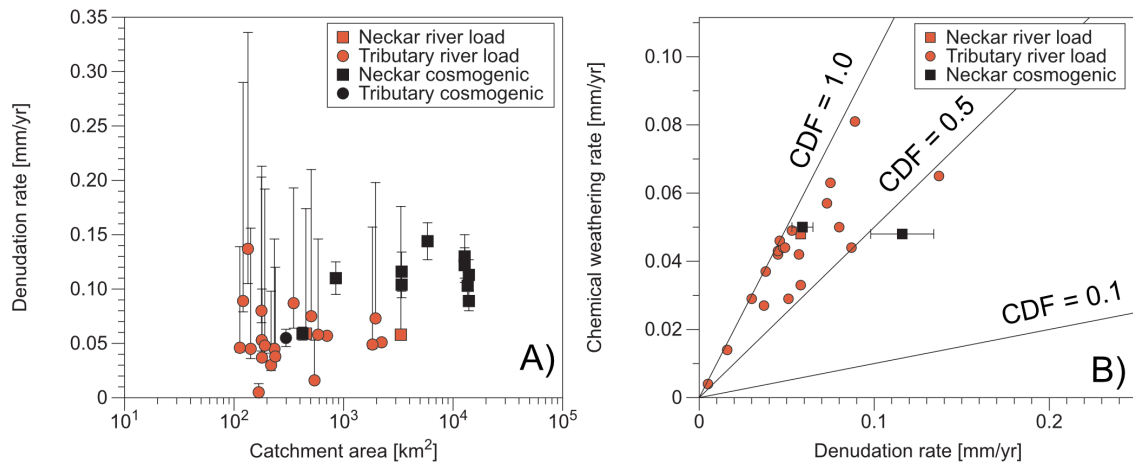

Figure S6: Total denudation rate based on river load (red circles, this study) compared to cosmogenic nuclide-derived denudation rates from in situ-produced ¹⁰Be in quartz (Schaller et al., 2001 and 2002; black squares). A) Denudation rate versus catchment area. B) Chemical weathering rate versus total denudation rates based on river load and the combination of river load and cosmogenic nuclide-derived rates. Lines indicate different chemical depletion fractions, CDF.
