

Supplement of

Sensitivity Studies of Four-Dimensional Local Ensemble Transform Kalman Filter Coupled With WRF-Chem Version 3.9.1 for Improving Particulate Matter Simulation Accuracy

Accuracy

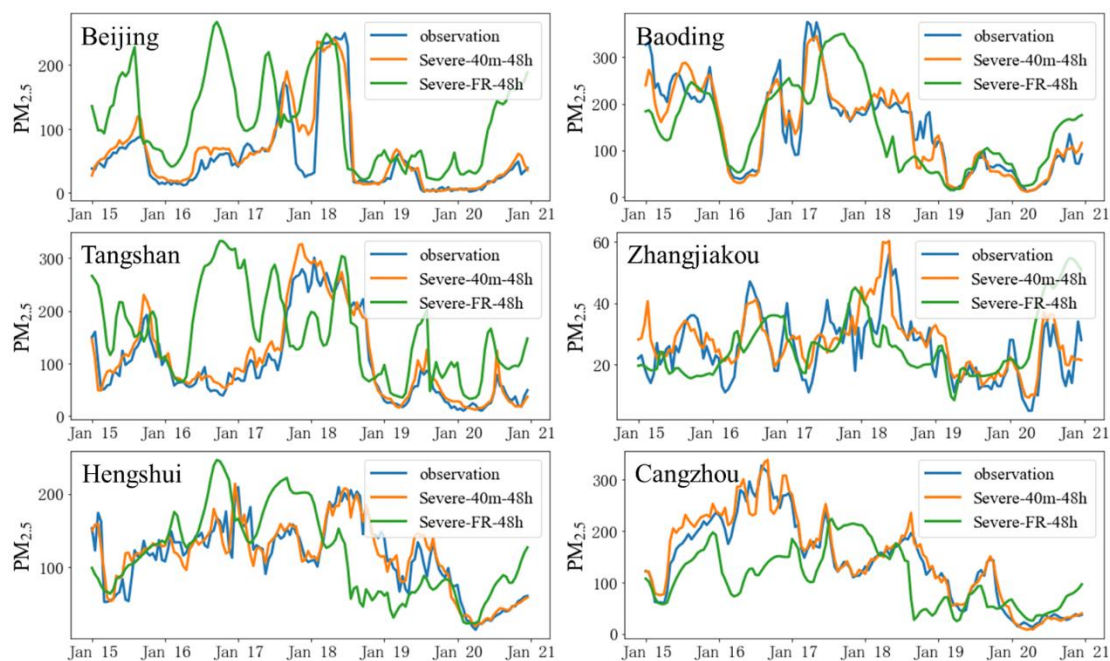

Figure S1. Temporal variations of PM_{2.5} from Severe-40m-48h, Severe-FR-48h and

observation at six independent verification stations (units: $\mu\text{g m}^{-3}$).

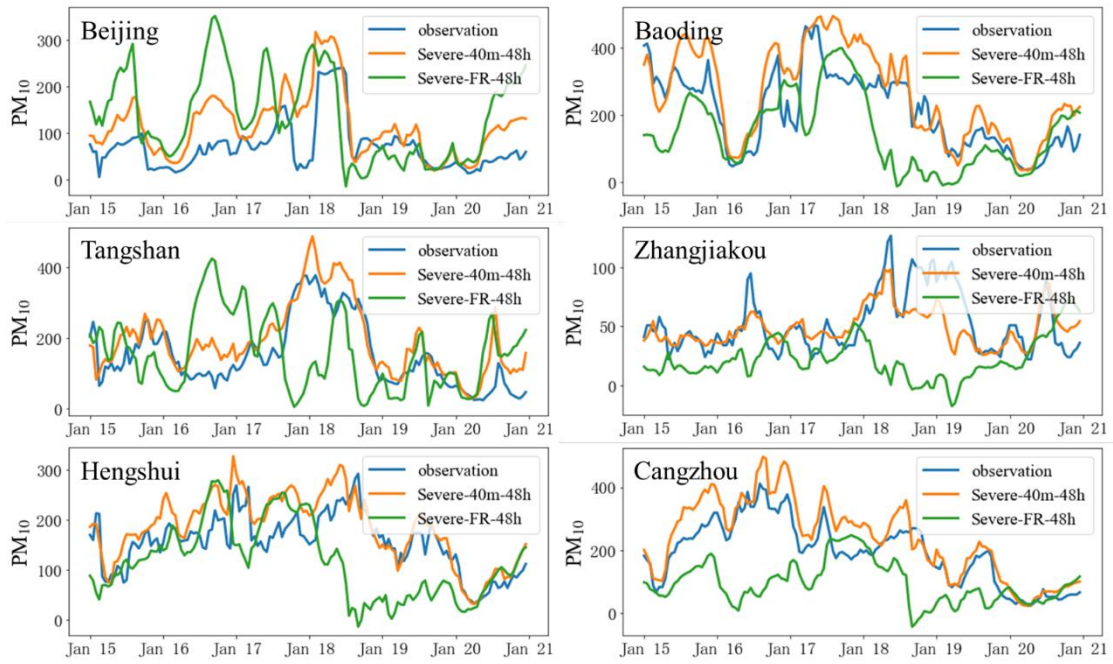

Figure S2. Similar with Figure S2 but for PM₁₀.

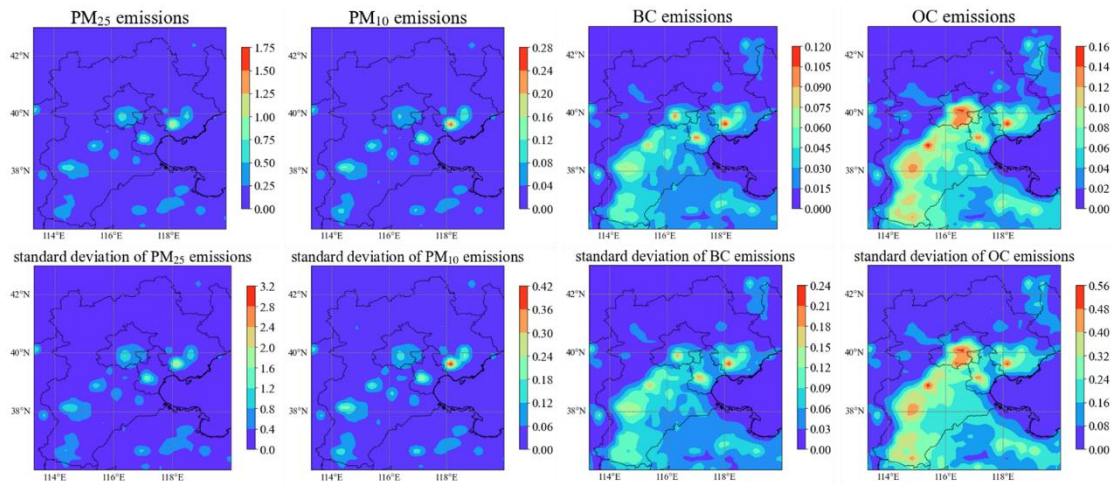

Figure S3. Contour maps about spatial distribution of anthropogenic PM_{2.5}, PM₁₀, BC and OC

emissions in first row (units: $\mu\text{g m}^{-2} \text{s}^{-1}$) and their standard deviations calculated from 40

ensemble members in second row.

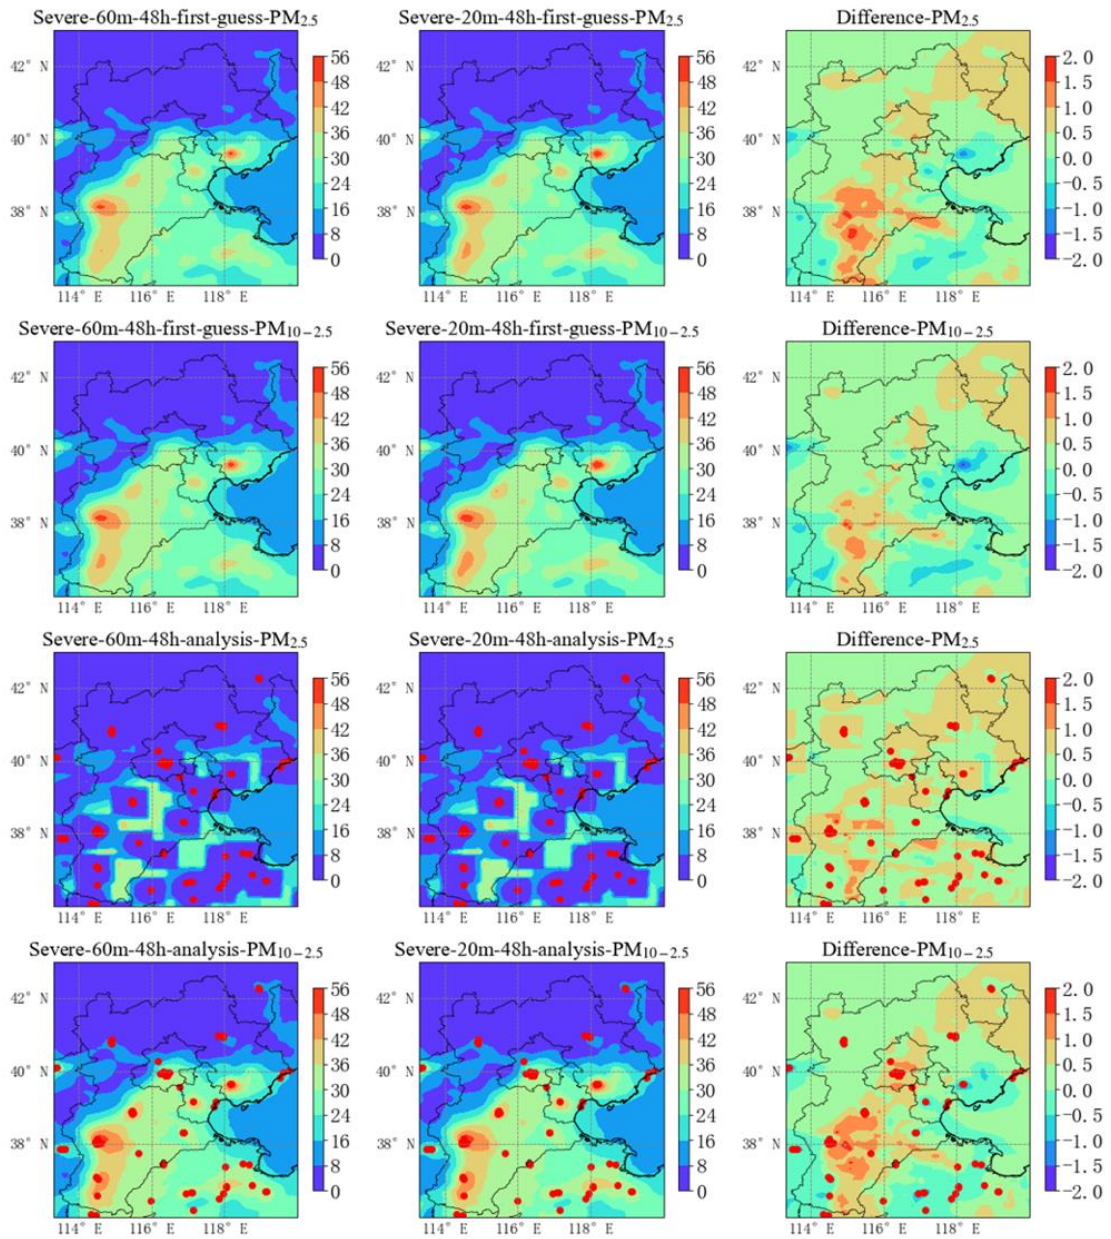

Figure S4. Contour maps of spatial distributions of temporal averaged $PM_{2.5}$ and $PM_{10-2.5}$ standard deviations in the first guess (first and second row) and analysis (third and fourth row) of (Severe-60m-48h minus Severe-20m-48h) within simulation period (units: $\mu g m^{-3}$).

The red dots in analysis of $PM_{2.5}$ and $PM_{10-2.5}$ implies the location of assimilated stations.

Figure S5. Temporal variation about air quality index at six representative sites in moderate haze event.

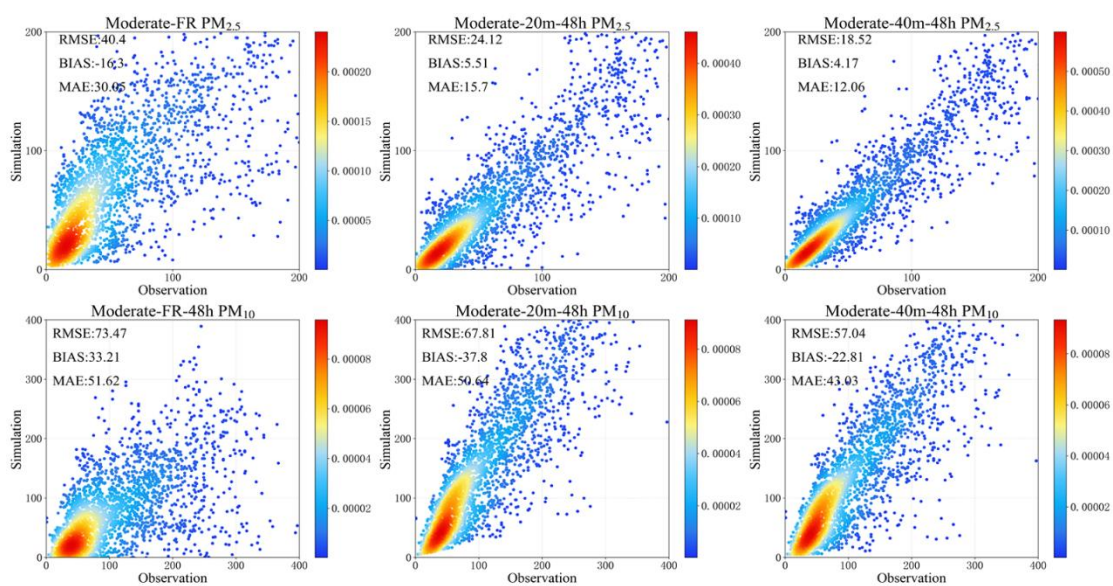

Figure S6. Scatter and density plots of PM_{2.5} and PM₁₀ observations from verification stations versus those in Moderate-FR-48h, Moderate-20m-48h and Moderate-40m-48h (units: $\mu\text{g m}^{-3}$).

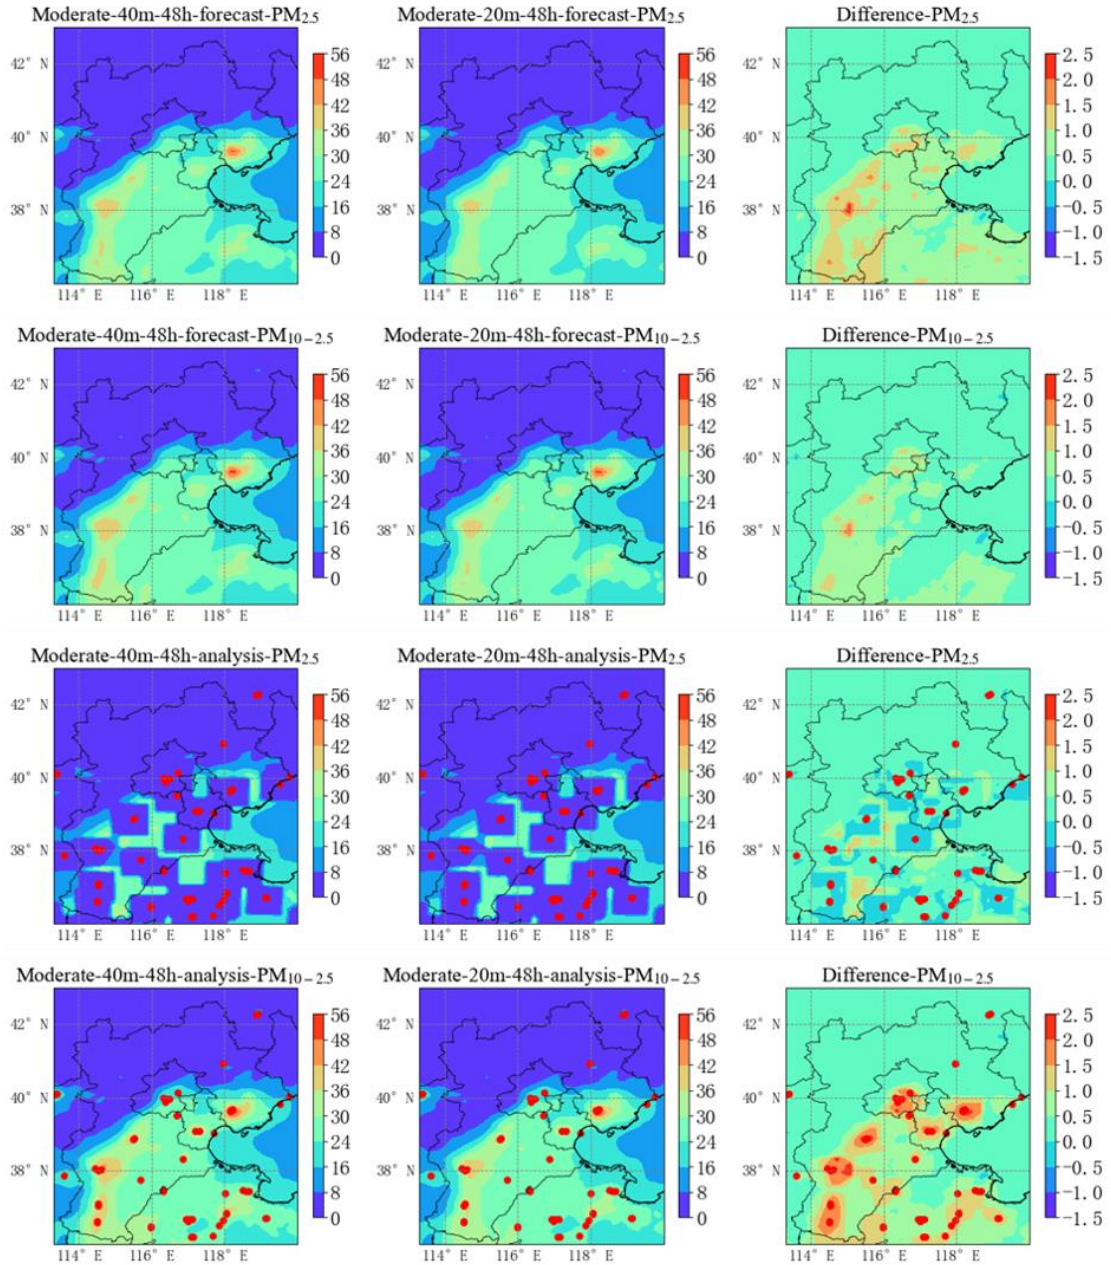

Figure S7. Contour maps of spatial distributions of temporal averaged PM_{2.5} and PM_{10-2.5} standard deviations in the first guess (first and second row) and analysis (third and fourth row) of Moderate-40m-48h, Moderate-20m-48h and their difference (Moderate-40m-48h minus Moderate-20m-48h) in a moderate haze event (units: $\mu\text{g m}^{-3}$). The red dots in analysis of PM_{2.5} and PM_{10-2.5} implies the location of assimilated stations.
