

Supporting Information

5 Figure S1: Example of typical time profiles of α-phellandrene and products detected with PTR-ToF-MS (NO⁺ and H₃O⁺ ionization modes) for the experiment of 06/03/2021. The N₂O₅ injection period is shown by the yellow area.

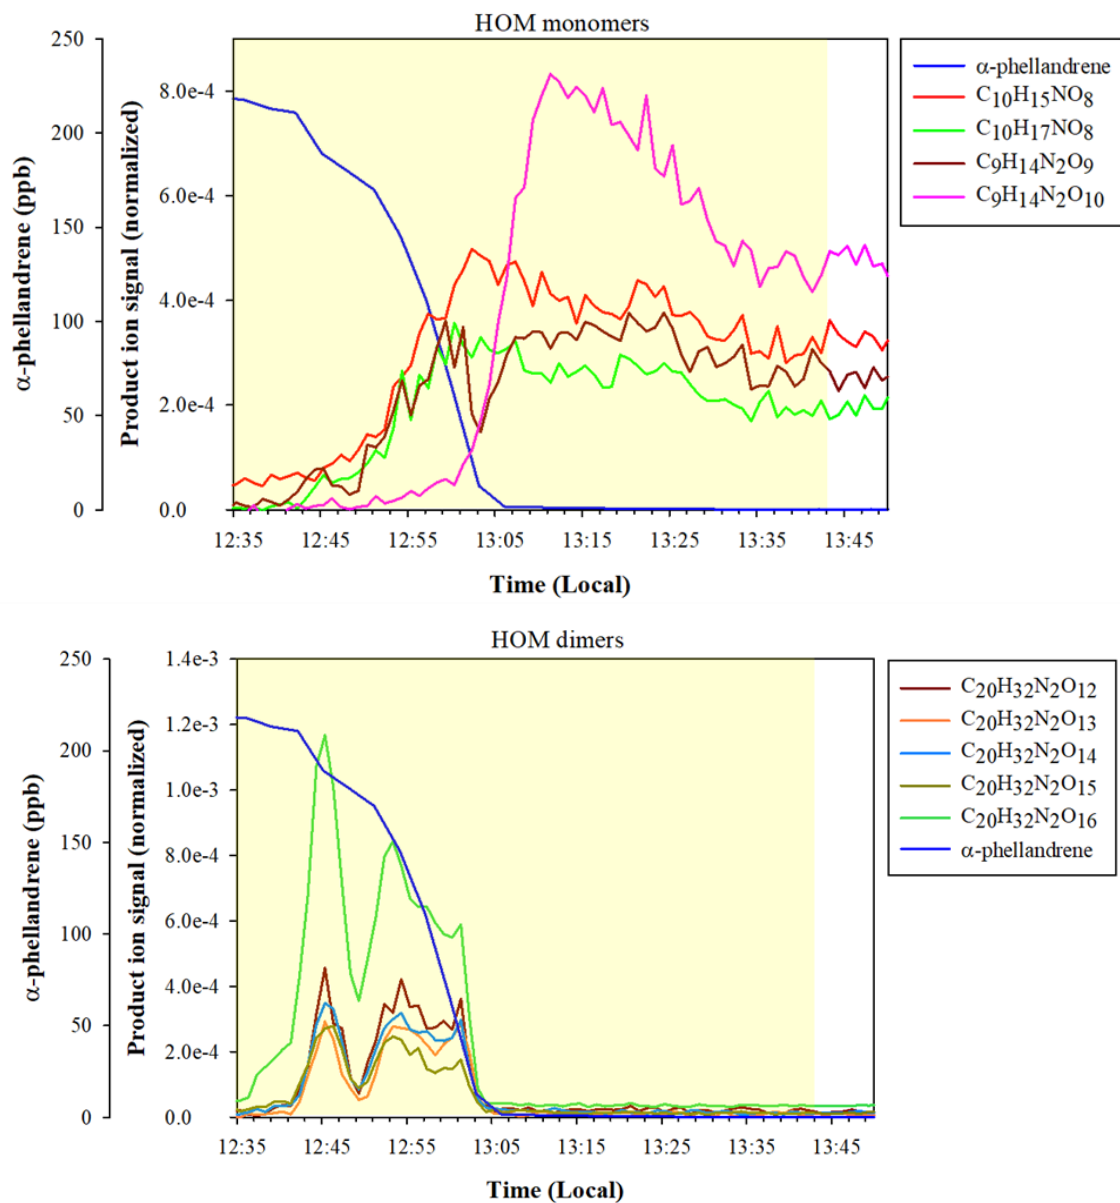

Figure S2: Time profiles of a selection of gas-phase HOM monomers and dimers produced by the oxidation of α -phellandrene by NO_3 radical (experiment 06/02/2021). The N_2O_5 injection period is shown by the yellow area.

10

Figure S3: Odum parametrization describing the dependence of the SOA yields with the aerosol content (in $\mu\text{g}/\text{m}^3$) for α - and β -phellandrenes (this study), α - and γ -terpinenes (Fouqueau et al., 2020) and terpinolene (Fouqueau et al., 2022).

Table S1: Products detected by PTR-ToF-MS in H_3O^+ and NO^+ ionization modes for the oxidation by NO_3 radical of α - and β -phellandrenes: raw formula, molecular weight, detected mass, ionization process (H^+ as proton adduct; NO^+ as NO^+ adduct; CT as charge transfer), and behavior.

15

Molecule		H_3O^+ ionization mode			NO^+ ionization mode		
Raw formula	M (g mol^{-1})	m/z	Process	Behavior	m/z	Process	Behavior
α-phellandrene							
$\text{C}_3\text{H}_6\text{O}$	58	59.0383	H^+	Primary-Secondary	88.0268	NO^+	Primary-Secondary

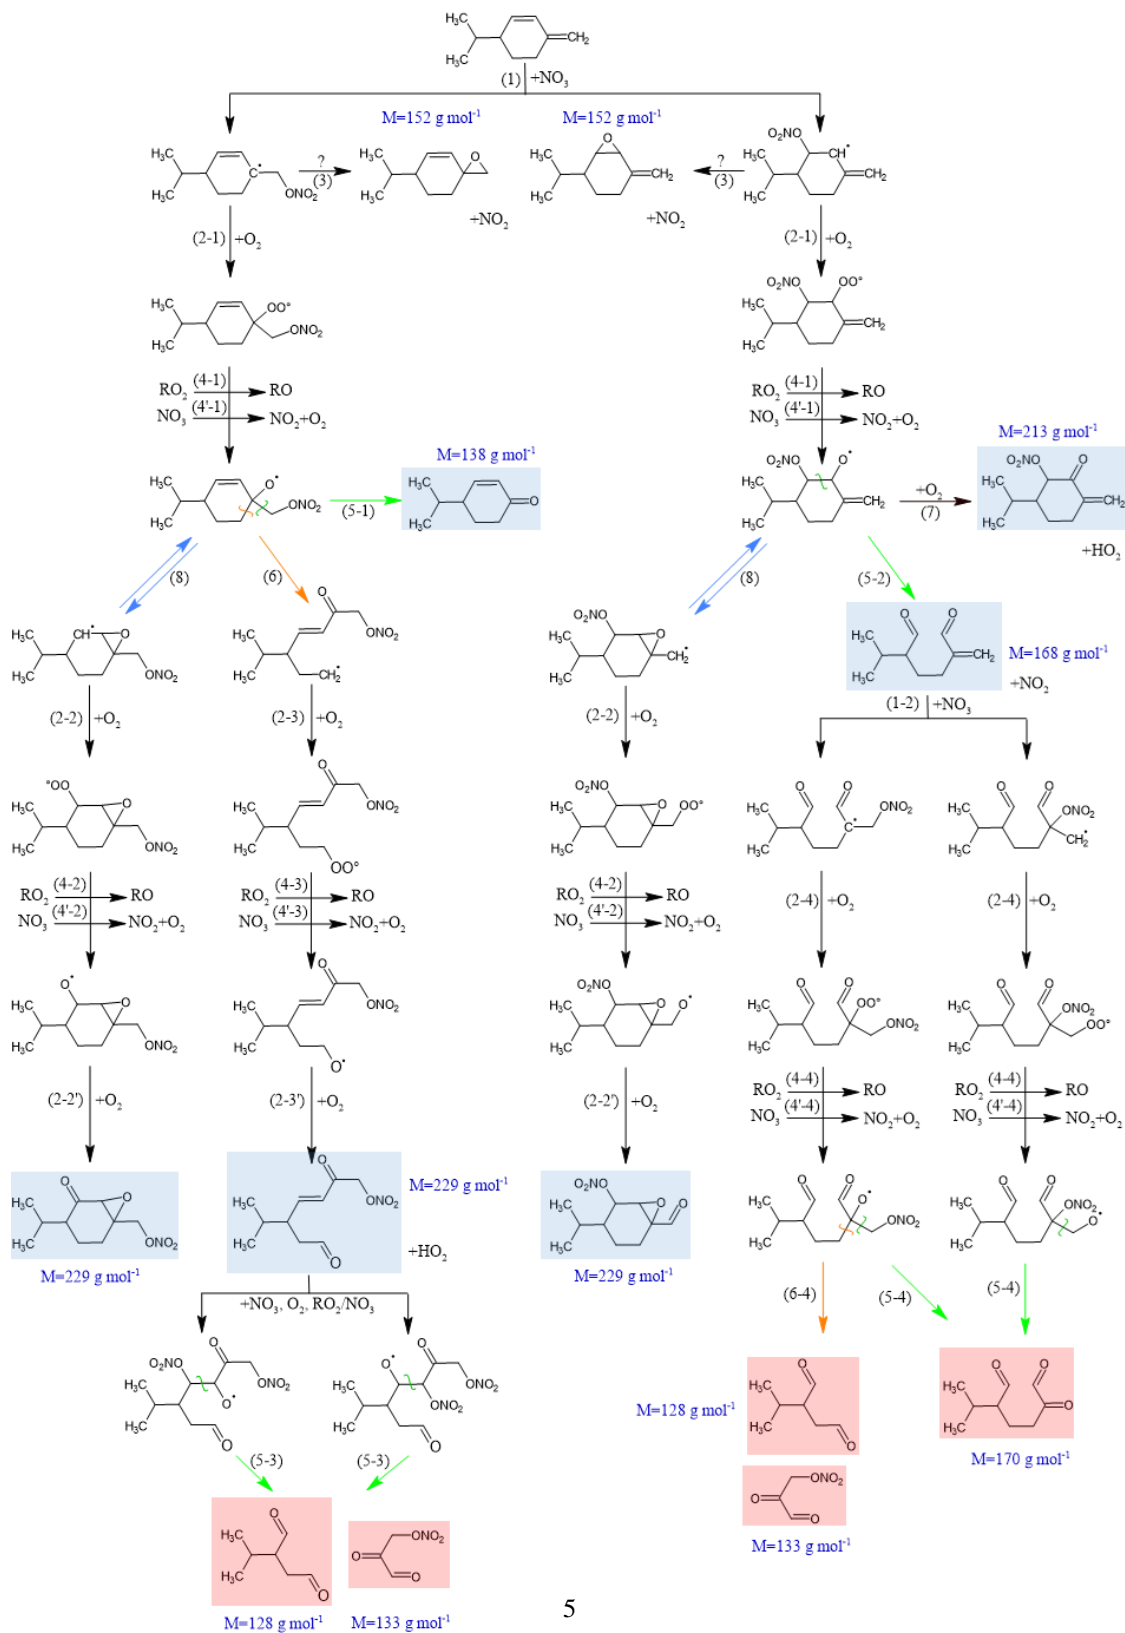

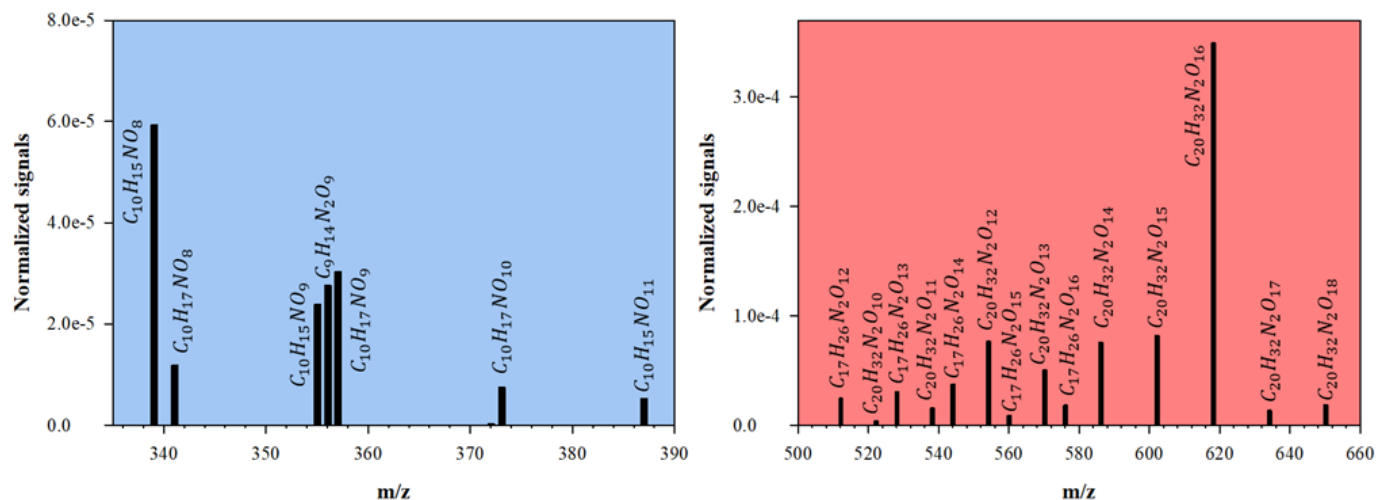

Figure S4: Proposed mechanism for the reaction β -phellandrene+NO₃. First-generation products are colored in blue, and second-generation ones are colored in red.

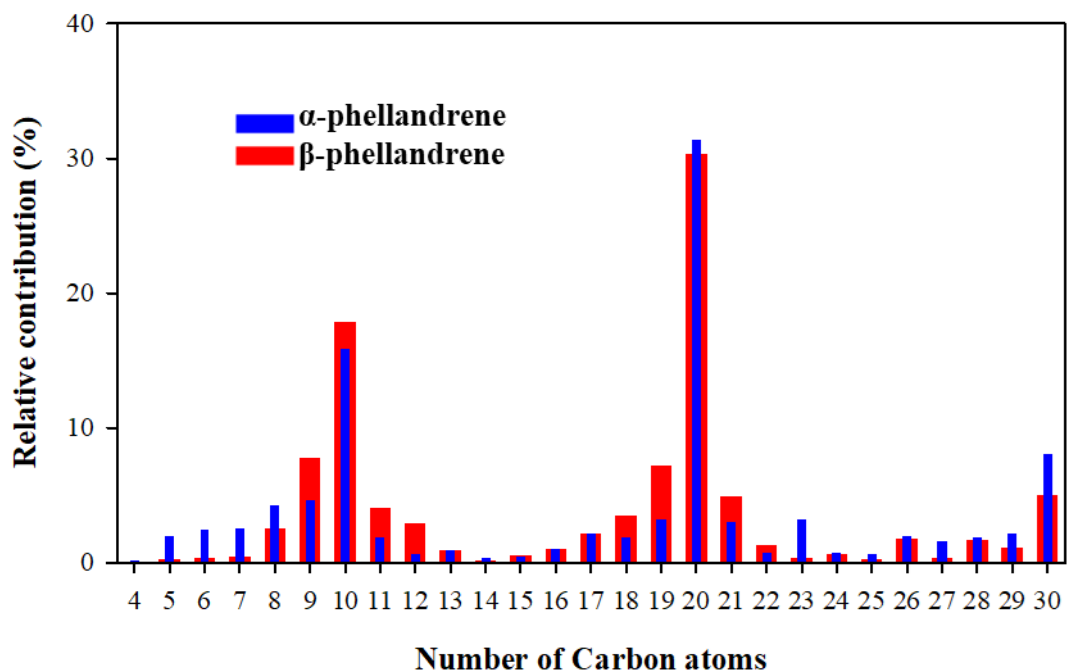

20

Figure S5: Average mass spectra of gas-phase HOMs for the NO₃-oxidation of α -phellandrene (average performed over 10 min following the start of the oxidation - experiment 02/06/2021). Labels display raw formulas of detected species, excluding the nitrate reagent ion cluster, but the m/z values (x-axis) include the nitrate mass (61.9883 m/z). Product signals are normalized to the reagent ion signals.

25

Figure S6: Average mass spectra measured of gas-phase HOMs for the NO₃-oxidation of β -phellandrene (average performed over 10 min following the start of the oxidation - experiment 03/24/2021). Labels display raw formulas of detected species, excluding the nitrate reagent ion cluster, but the m/z values (x-axis) include the nitrate mass (61.9883 m/z). Product signals are normalized to the reagent ion signals.

30

Figure S7. Distribution of the products detected in the aerosol phase as a function of the number of carbon atoms, for α - and β -phellandrenes.
