

**Comments on the second version of “Kinematic properties of regions that can involve persistent contrails” by Sina Maria Hofer and Klaus Martin Gierens
(<https://doi.org/10.5194/egusphere-2024-3520>)**

This is the second time I have reviewed this manuscript after it was revised by the authors. Therefore, a summary of the manuscript is not given here.

I would like to thank the authors for considering and responding to the comments from the first round of reviews. This has improved the understanding of the paper and made the conclusions more accessible to a wider audience, and I agree with the changes made.
