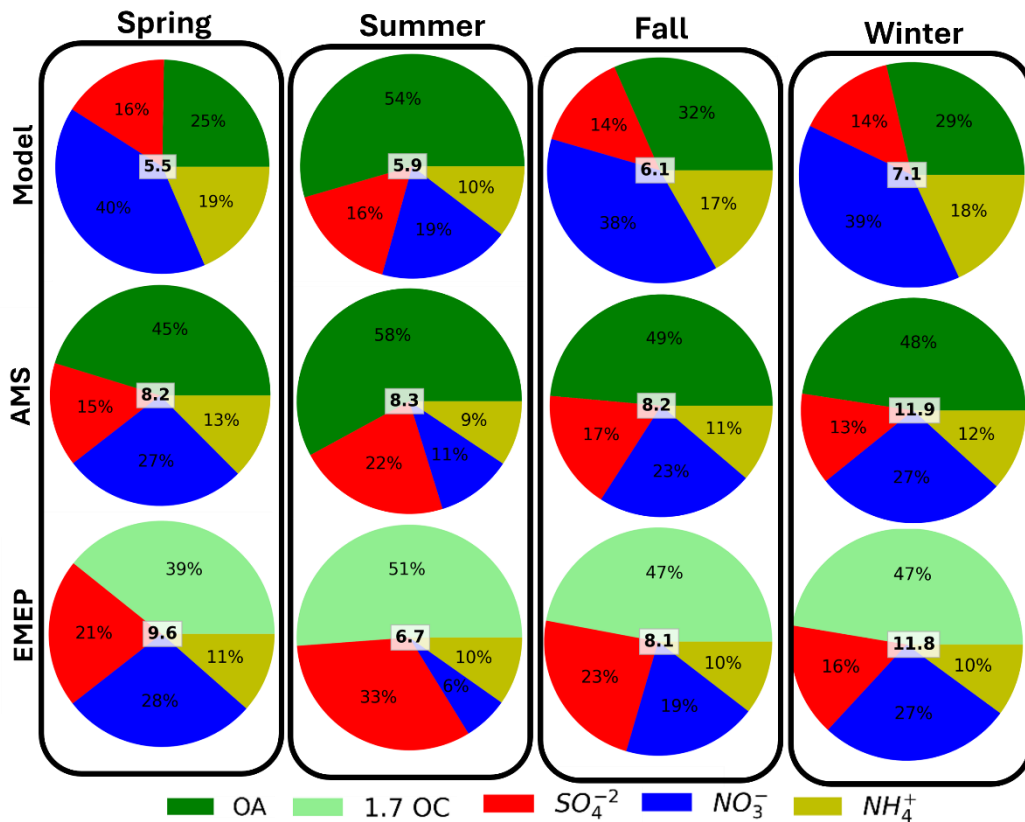

Figure S1. Seasonal aerosol composition in Europe from EMAC simulation, AMS observations and EMEP filter measurements during 2000-2020. The white boxes indicate the seasonal mean of the total PM concentration (in $\mu\text{g m}^{-3}$), the numbers in the respective pie slices indicate the relative contribution of each element (in %).

Figure S2. Seasonal aerosol composition in North America from EMAC simulation, AMS observations and IMPROVE and EPA filter measurements during 2000-2020. The white boxes indicate the seasonal mean of the total PM concentration (in $\mu g m^{-3}$), the numbers in the respective pie slices indicate the relative contribution of each element (in %).

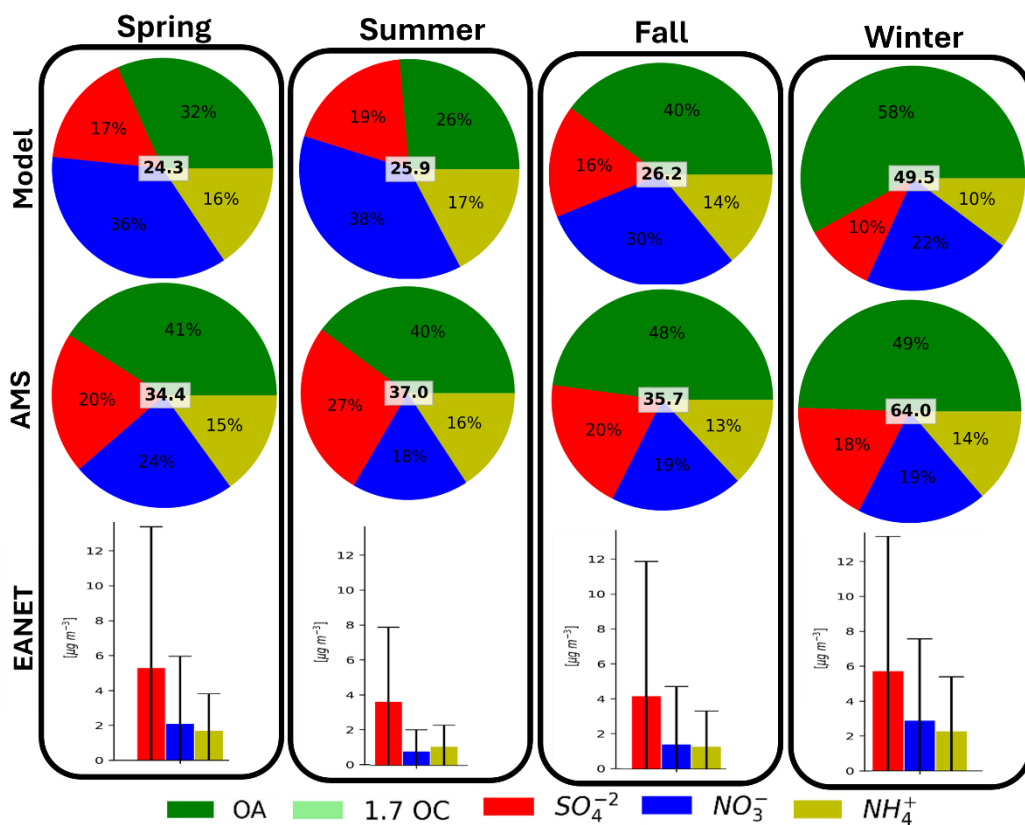

Figure S3. Seasonal aerosol composition in Eastern Asia from EMAC simulation, AMS observations and EANET filter measurements during 2000-2020. The white boxes indicate the seasonal mean of the total PM concentration (in $\mu\text{g m}^{-3}$), the numbers in the respective pie slices indicate the relative contribution of each element (in %).

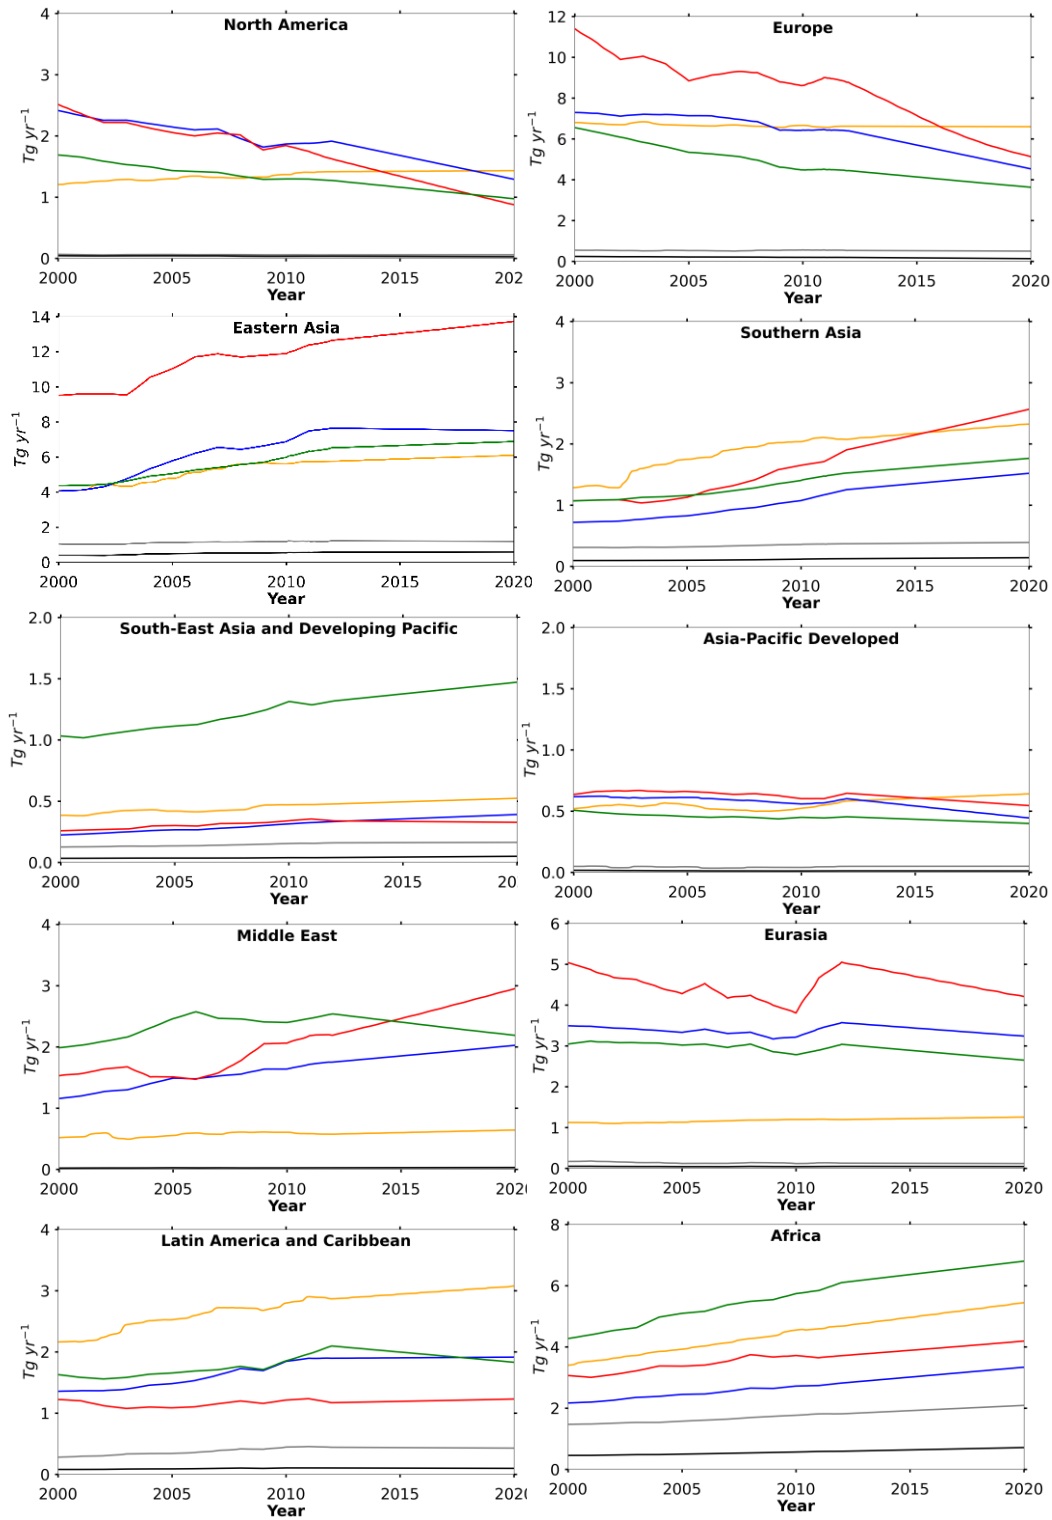

Figure S4. Temporal evolution of pollutant emissions in $Tg\ yr^{-1}$ of OC (grey), BC (black), NH_3 (orange), NO_x (blue), SO_2 (red), and VOC (green) during the period 2000-2020 in the 10 regions considered according to WGIII AR6.

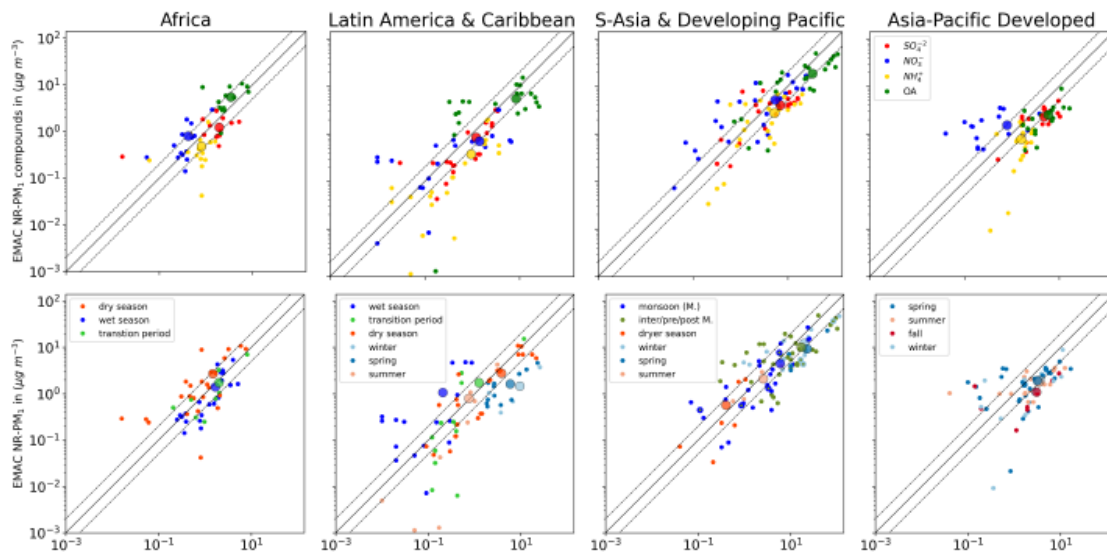

Figure S5. Scatter plots comparing EMAC results for PM_{10} concentrations (in $\mu g m^{-3}$) with AMS and ASCM observations (top row) colored by the season of the field campaign and (bottom row) colored by the chemical composition. Each point represents the mean of the data set. Also shown are the 1:1, 2:1, and 1:2 lines.

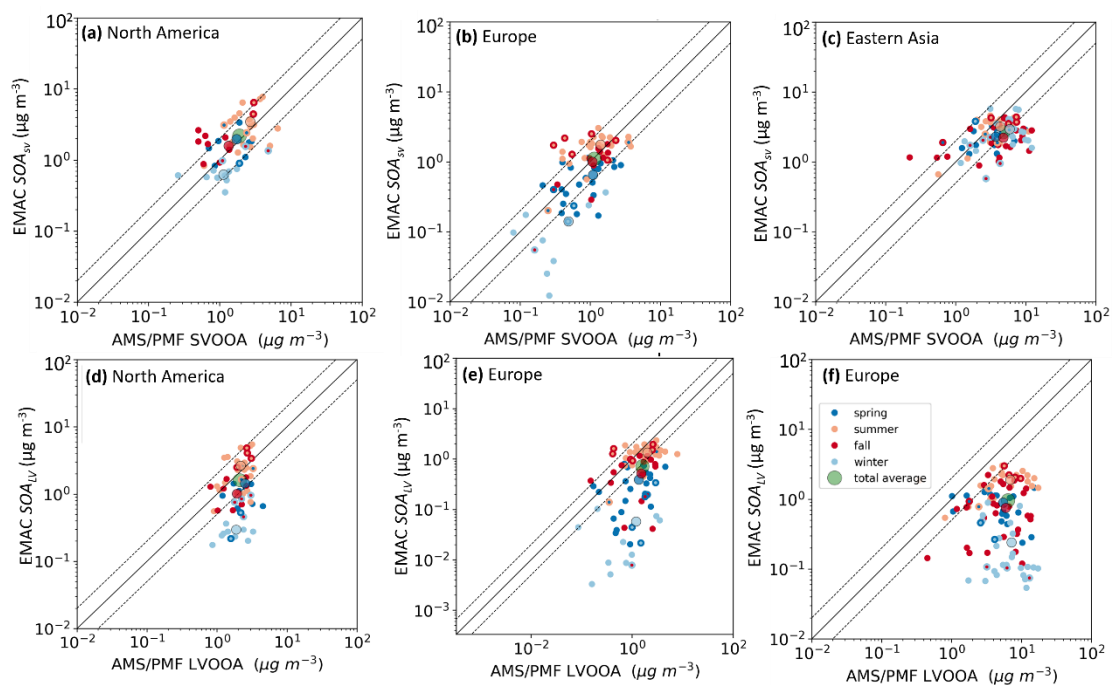

Figure S6: Scatter plots comparing model results for PM_1 SOA_{SV} (a-c) and SOA_{IV} (d-f) concentrations (in $\mu\text{g m}^{-3}$) with AMS and ASCM observations of M-OOA and L-OOA, respectively, over North America (a, d), Europe (b, e), and Eastern Asia (c, f). Each point represents the data set mean and is colored based on the season of the field campaign. Also shown are the 1:1, 2:1, and 1:2 lines.
