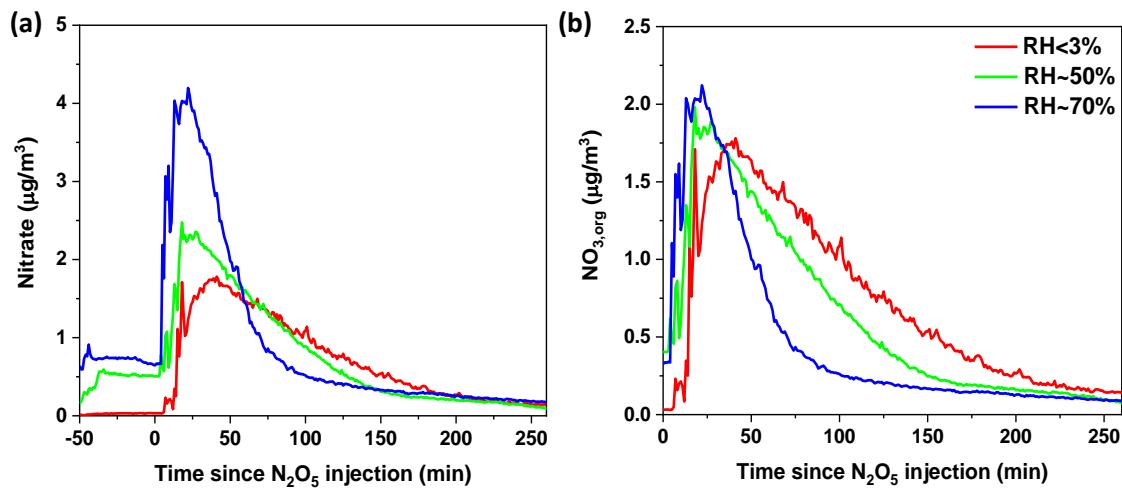

Figure S2. Typical time profile of the decay of styrene over time measured by GC-FID and aerosol formation (volume concentration) measured by SMPS, particle wall loss corrected (Exp. 7).

31

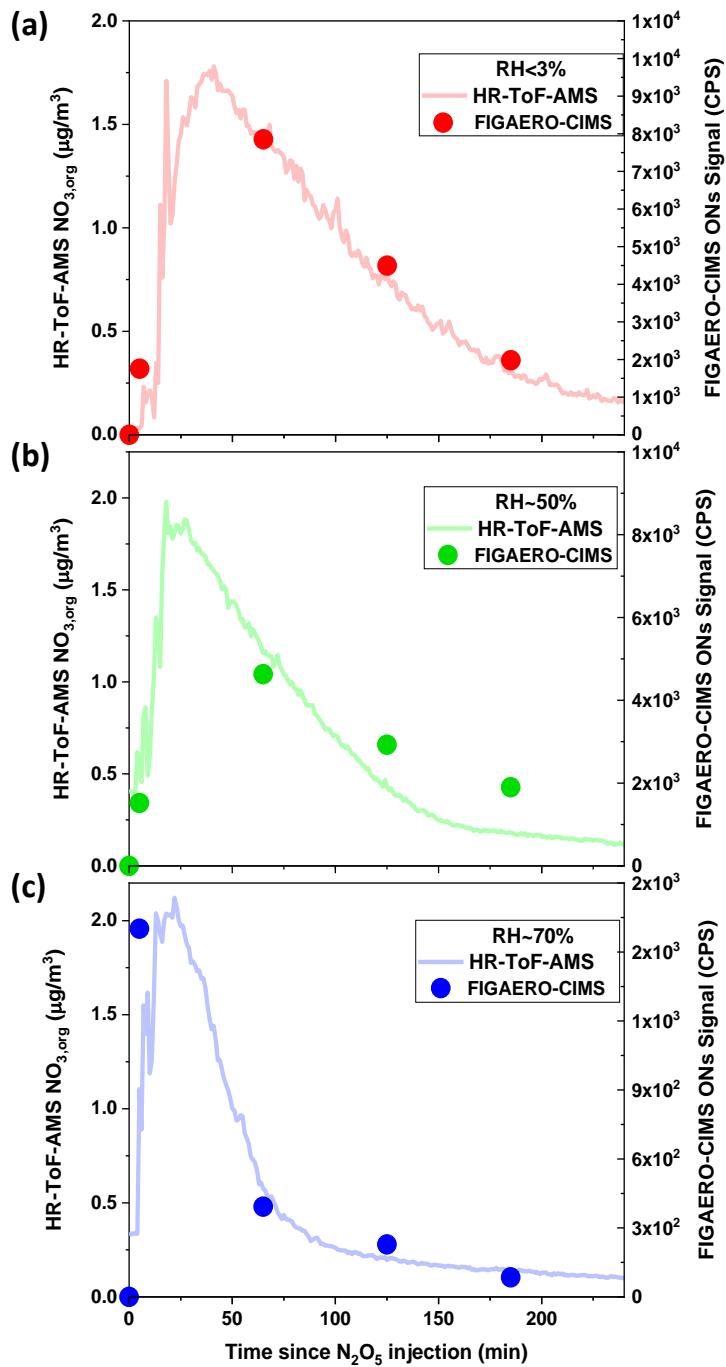

32

33 **Figure S3.** (a) Time series of mass concentrations of organics and nitrate (normalized to the sulfate mass
 34 concentration); (b) Time series of mass concentrations of C_xH_y , $\text{C}_x\text{H}_y\text{O}$, $\text{C}_x\text{H}_y\text{O}_z$, $\text{C}_x\text{H}_y\text{ON}$, and $\text{C}_x\text{H}_y\text{O}_z\text{N}$
 35 families (normalized to the sulfate mass concentration) measured by HR-ToF-AMS (Exp. 7).

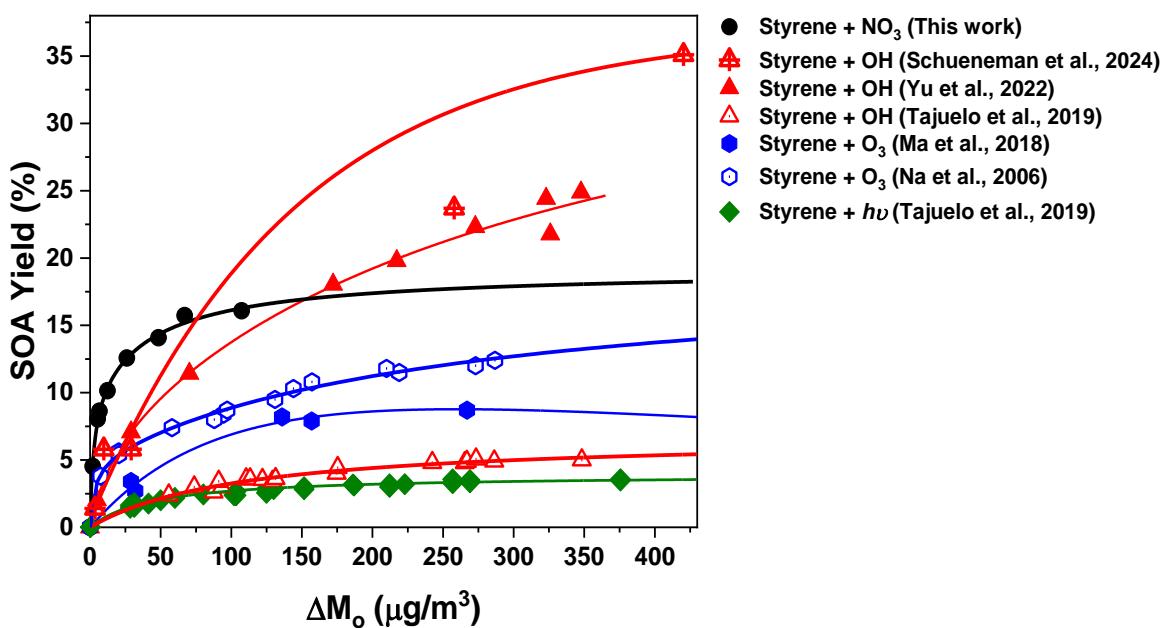

36
37 **Figure S4.** Time series of (a) nitrate measured by HR-ToF-AMS and (b) organic nitrates ($\text{NO}_{3,\text{org}}$) from
38 Exp. 2 ($\text{RH}<3\%$), Exp. 11 ($\text{RH}\sim 50\%$), and Exp. 12 ($\text{RH}\sim 70\%$).

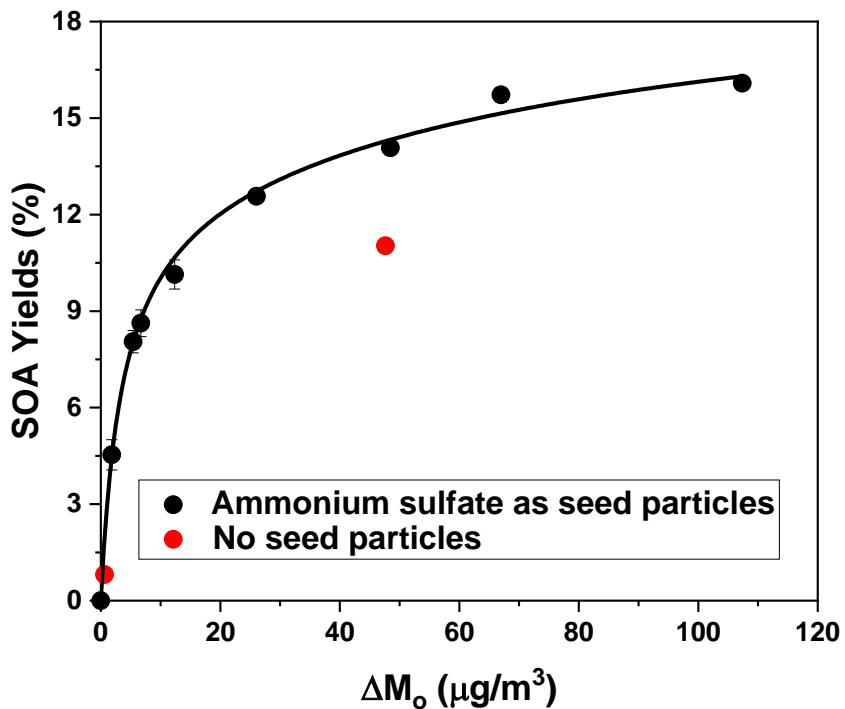

39

40 **Figure S5.** Time series of organic nitrates ($\text{NO}_3,_{\text{org}}$) measured by HR-ToF-AMS and the sum of ON signals
 41 measured by FIGAERO-CIMS: (a) RH<3% (Exp. 2); (b) RH~50% (Exp. 11); and (c) RH~70% (Exp. 12).

42
 43 **Figure S6.** Comparison of SOA yields of styrene oxidation systems in this work and in literature (Yu et al.,
 44 Tajuelo et al., 2019; Ma et al., 2018; Na et al., 2006; Schueneman et al., 2024). The SOA yields and
 45 ΔM_O in Schueneman et al., (2024) and in Tajuelo et al., (2019) are extracted by WebPlotDigitizer.

46
47 **Figure S7.** SOA yields of styrene+ NO_3 oxidation: with seed particles (filled circles; fitted to yield curve)
48 and without any seed particles (red dots for Exp. 9 and 10).

49 **Accounting for vapor wall loss in determining SOA yields**

50 To evaluate the potential effect of organic vapor wall loss on SOA yields in our study, experiments
 51 without seed particles are carried out. As shown in Figure S7, the SOA formation from nucleation
 52 experiments (without seed particles) are lower than condensation experiments (with seed particles). We
 53 employ the semi-empirical equation based on gas-to-particle partitioning of two semi-volatile products
 54 (Odum et al., 1996, 1997) for SOA yields to correct for vapor wall loss in SOA yield determination (Eq.
 55 S1).

$$56 \quad Y = \Delta M_O \left[\frac{\alpha_1 K_1}{1+K_1 M_O} + \frac{\alpha_2 K_2}{1+K_2 M_O} \right] \quad \text{Eq. S1}$$

57 Where Y is the SOA yield, M_O is the aerosol mass loading, α_1 and α_2 are the fitted molar yields of the
 58 two products, and K_1 and K_2 are the fitted partitioning coefficients of the two products. K is inversely
 59 proportional to the saturation mass concentration (C^*) of each pure semi-volatile compound. The correction
 60 relies on the assumption that styrene+NO₃ oxidation yields two major products. After correcting for particle
 61 wall loss, the total mass of products (C) can reside in three components: in the gas phase (C_g), in the particle
 62 phase (C_p), and on the chamber wall (C_w) due to vapor wall loss. In the two-product semi-empirical model,
 63 the term α represents the fitted molar yield. Therefore, the total mass concentration of products can also be
 64 expressed as the products of the fitted molar yield and the amount of styrene reacted (ΔHC) as shown in
 65 Eq. S2 and S3.

$$66 \quad C_g^1 + C_p^1 + C_w^1 = \Delta HC \times \alpha_1 \quad \text{Eq. S2}$$

$$67 \quad C_g^2 + C_p^2 + C_w^2 = \Delta HC \times \alpha_2 \quad \text{Eq. S3}$$

68 According to the two-layer model in Huang et al., (2018), the vapor wall loss is the overall decay of
 69 vapor molecules in the surface and inner layers of the chamber wall after equilibrium (Eq. S4). As shown
 70 in Eq. S5 and S6, C_w can be calculated from C_g , activity coefficient in Teflon film (r_1^∞), C^* , and equivalent
 71 total wall concentration (C_{TW} , sum of C_w^1 and C_w^2).

$$72 \quad C_{TW} = \frac{10.8*A}{V} \quad \text{Eq. S4}$$

$$73 \quad C_g^1 = C_1^* \times r_1^\infty \times \frac{C_w^1}{C_{TW}} = C_1^* \times 10^{3.299} \times (C_1^*)^{-0.6407} \times \frac{C_w^1}{\frac{10.8*A}{V}} \quad \text{Eq. S5}$$

$$74 \quad C_g^2 = C_2^* \times r_2^\infty \times \frac{C_w^2}{C_{TW}} = C_2^* \times 10^{3.299} \times (C_2^*)^{-0.6407} \times \frac{C_w^2}{\frac{10.8*A}{V}} \quad \text{Eq. S6}$$

75 Where A refers to the chamber surface area (m²) and V refers to chamber volume (m³).

76 According to previous work (Pankow, 1994a, b) , C_g can be calculated from C_p , C^* , and M_O (Eq. S7
 77 and S8).

$$78 \quad C_g^1 = C_1^* \times \frac{C_p^1}{M_O} \quad \text{Eq. S7}$$

$$79 \quad C_g^2 = C_2^* \times \frac{C_p^2}{M_O} \quad \text{Eq. S8}$$

Therefore, Eq. S2 and S3 can be rewritten to Eq. S9 and S10, respectively:

$$81 \quad C_1^* \times \frac{C_p^1}{M_O} + C_p^1 \times \frac{C_p^1 \times C_{TW}}{M_O \times r_1^\infty} = \Delta HC \times \alpha_1 \quad \text{Eq. S9}$$

$$C_2^* \times \frac{C_p^2}{M_O} + C_p^2 + \frac{C_p^2 \times C_{TW}}{M_O \times r_2^\infty} = \Delta HC \times \alpha_2 \quad \text{Eq. S10}$$

83 The two-product semi-empirical model (Eq. S1) can also be rewritten to Eq. S11:

$$Y = \frac{\Delta M_O}{\Delta HC} = \frac{C_p^1 + C_p^2}{\Delta HC} = \frac{\frac{\Delta HC \times \alpha_1}{C_1^* \times \frac{1}{M_O} + 1 + \frac{C_{TW}}{M_O \times r_1^\infty}} + \frac{\Delta HC \times \alpha_2}{C_2^* \times \frac{1}{M_O} + 1 + \frac{C_{TW}}{M_O \times r_2^\infty}}}{\Delta HC} = \Delta M_O \left[\frac{\alpha_1 K_1}{1 + K_1 M_O + \frac{K_1 \times C_{TW}}{r_1^\infty}} + \frac{\alpha_2 K_2}{1 + K_2 M_O + \frac{K_2 \times C_{TW}}{r_2^\infty}} \right]$$

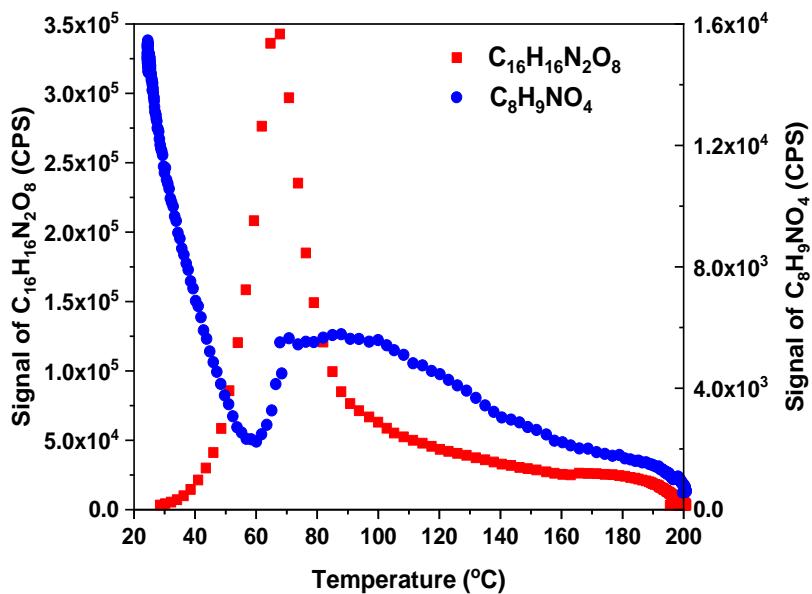

The ΔM_O and SOA yields after the correction are shown in Table S1. SOA yield curve after the correction is shown in Figure 1. The fitted molar yields (α_1 and α_2) are 0.84 and 0.14, and the fitted partitioning coefficients (K_1 and K_2) are 8.08×10^{-4} and 7.48 after vapor wall loss correction ($R^2 = 0.991$).

89

90 **Table S1.** SOA yield data for styrene+NO₃ oxidation with and without vapor wall loss correction.

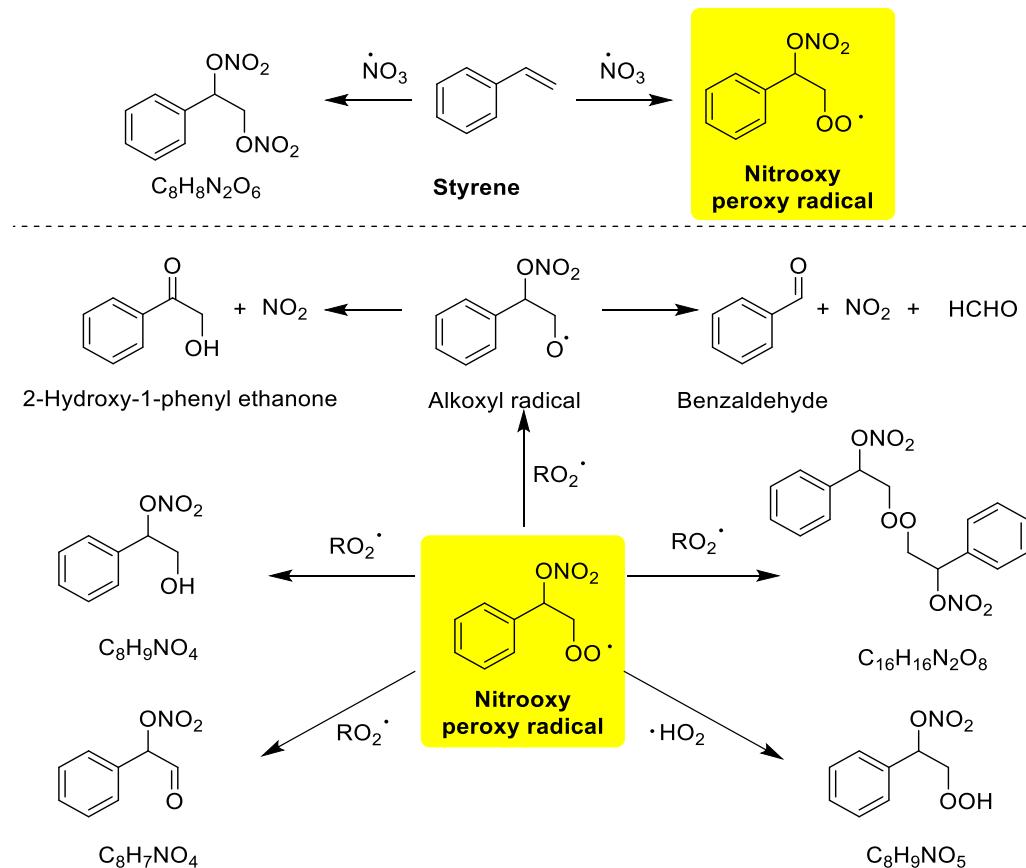

Exp	ΔM_O ($\mu\text{g m}^{-3}$)	Corrected ΔM_O ($\mu\text{g m}^{-3}$)	SOA Mass yield (%)	Corrected SOA Mass yield (%)
1	1.9	5.9	4.5	14.5
2	5.4	9.6	8.1	14.3
3	6.8	11	8.6	14.2

C ₂₀ H ₂₄ N ₂ O ₉	435.1482	10	2.71
C ₂₂ H ₂₆ N ₂ O ₈	445.1689	11	2.78
C ₂₀ H ₂₂ N ₂ O ₁₀	449.1274	11	2.71
C ₂₂ H ₂₆ N ₂ O ₉	461.1638	11	2.75

101 ^a. The molecular formula are obtained from a field campaign conducted in Shenzhen, China, using FIGAERO-CIMS. (Ye et al.,
102 2021) ^b. RDBE is ring and double-bond equivalence. RDBE = $\frac{\text{Carbon number} \times 2 + 2 - \text{Hydrogen number} + \text{Nitrogen number}}{2}$. ^c. Xc is
103 aromaticity equivalent. $Xc = \frac{3 \times (RDBE - (\text{Oxygen number} - 3 \times \text{Nitrogen number})) - 2}{RDBE - (\text{Oxygen number} - 3 \times \text{Nitrogen number})}$. The aromaticity equivalent equation, as discussed by
104 Yassine et al. (2014) and Wang et al. (2017), has been revised based on the assumption that the nitrooxy group requires three oxygen
105 atoms.
