Author Responses and Resulting Edits to *"A 60-year atmospheric nitrate isotope record from a Southeast Greenland ice core with minimal post-depositional alteration."*

Editor

Public justification (visible to the public if the article is accepted and published):

Figure 2: The colours are quite hard to tell apart (all quite dark) and the bottom panel is not so clearly related to the legend. Please try and select a brighter and more distinct colour scale and include the filled parts in the bottom panel more clearly in the legend. I also suspect the green red in the original colour scale is not colour blind friendly so please bare this in mind in the new colour scale.

Reply: We have modified Figure 2.

We also modified data availability statement as follows:
