

Fig. S1

Selectively dissolved Al + 0.5Fe [mg/g dry soil]

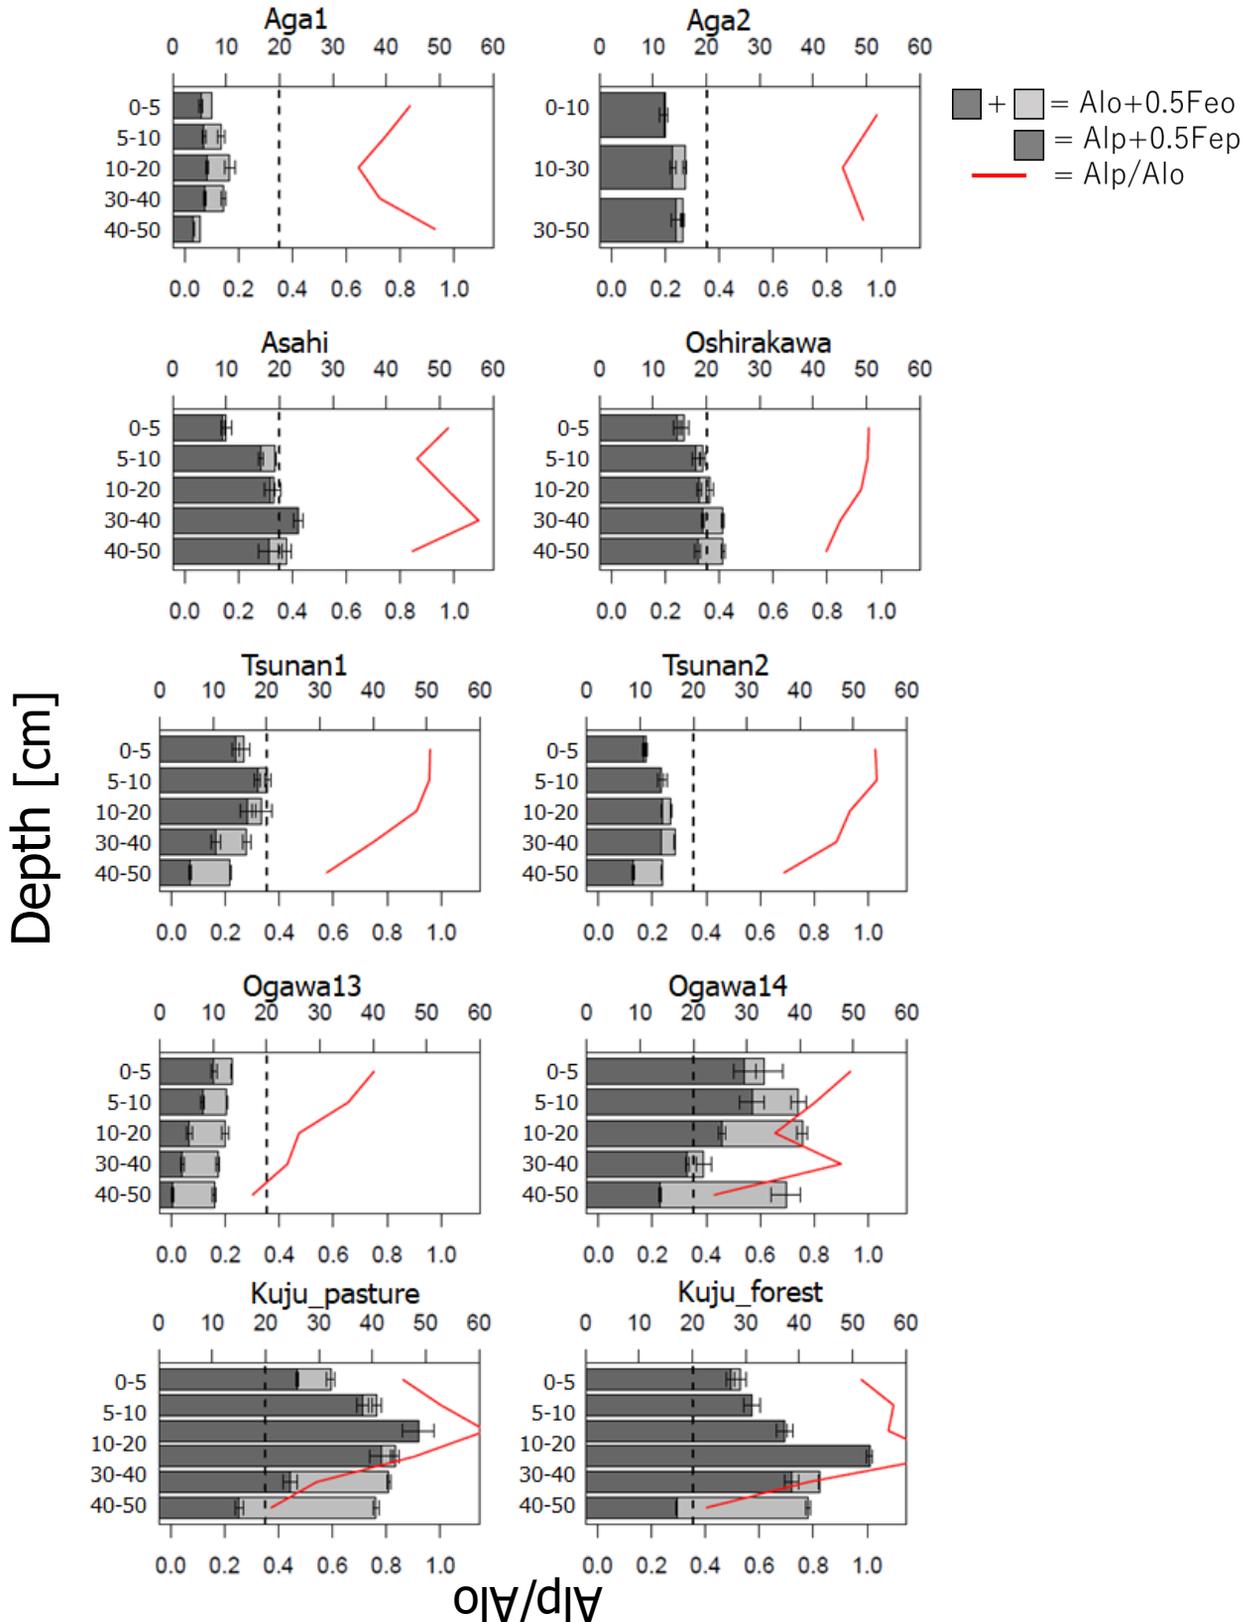

Fig. S1. Vertical profiles of selectively dissolved Al + 0.5Fe contents (Al_o+0.5Fe_o, Al_p+0.5Fe_p) and Al_p/Al_o for soils from 0 to 50cm depth.

Fig. S2

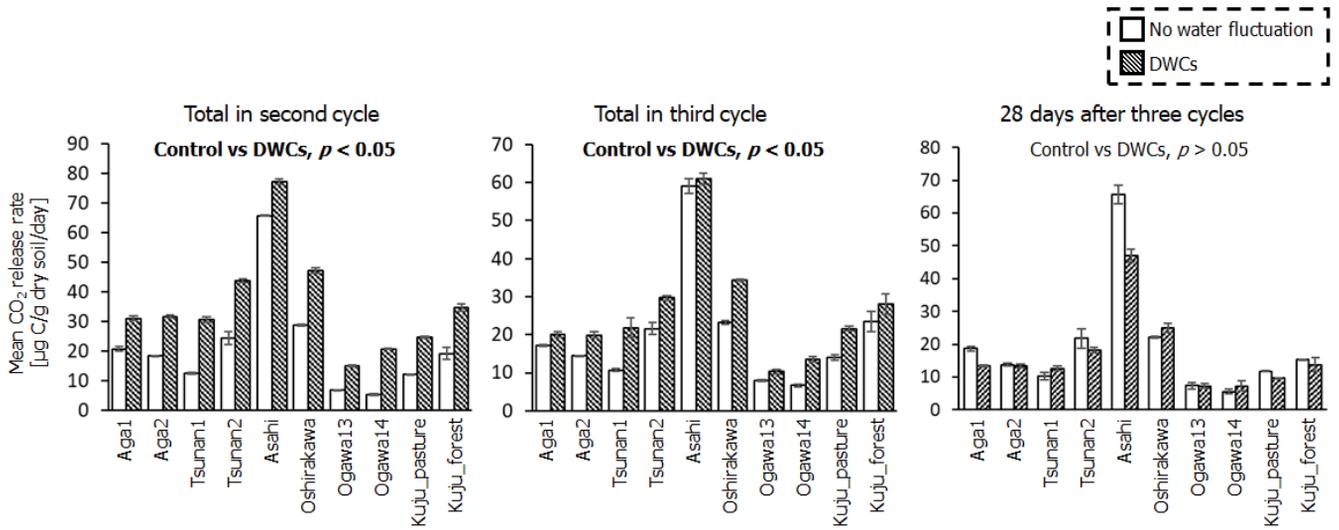

Fig. S2. Comparisons of mean CO₂ release rate for second cycle, third cycle, and the post 28-days incubation after the three cycles between DWCs and continuously constant moisture conditions. Statistically significant differences ($p < 0.05$ by pairwise t-test) in CO₂ release rate between two treatments were also presented.

Fig. S3

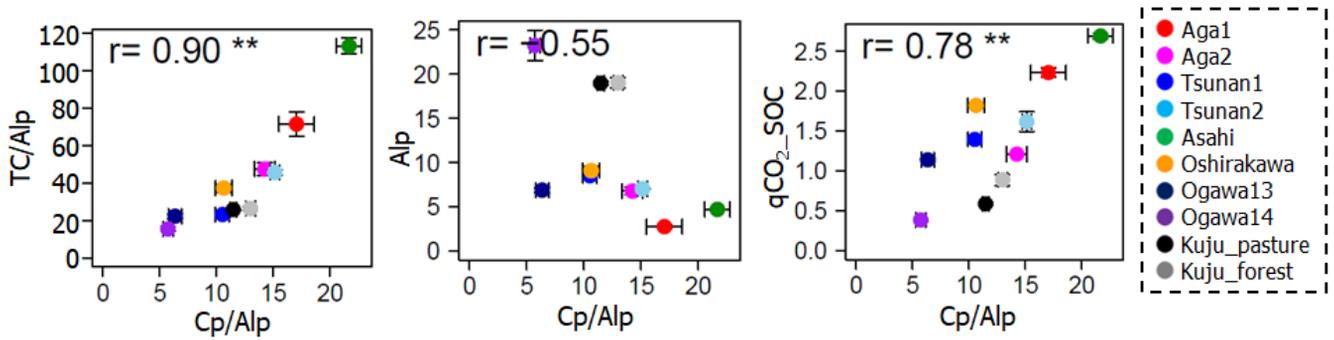

Fig. S3. Relations among soil Alp contents, Cp to Alp molar ratio, and qCO_2_soc . Statistically significant correlation coefficients at $p < 0.01$ and $p < 0.05$ are presented with single (*) and double asterisks (**), respectively.

Fig. S4

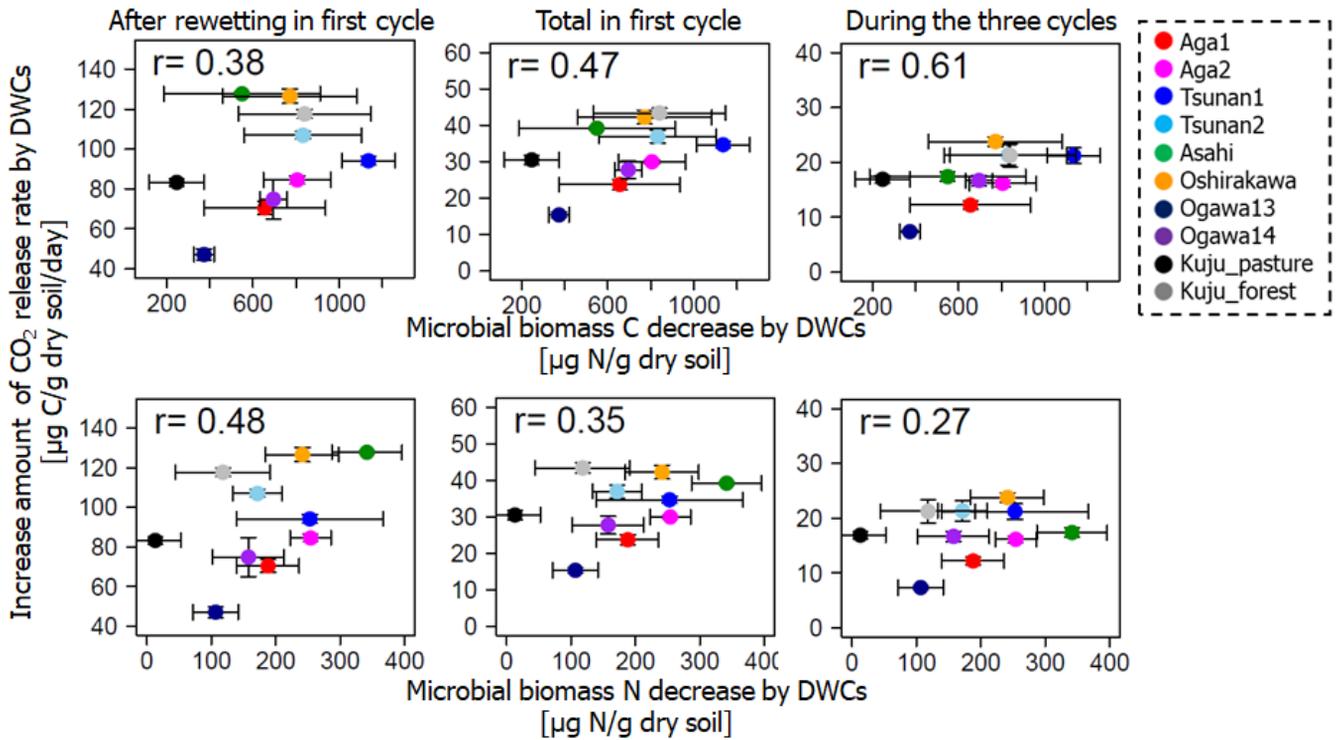

Fig. S4. Relations between the amount of CO₂ release increase and the microbial biomass C or N decrease by dry-wet cycles. There was no relationship showing significant correlation ($p > 0.05$).
