Supplementary Information

List of figures:

Figure S1. Number of observation data obtained from CE318-T at Zhongshan Station in (a) 2020, (b) 2021, (c) 2022, and (d) 2023, respectively.

Figure S2. (a)-(h) the frequency histograms of aerosol optical depth at 500 $_{nm}$ ($AOD_{500\ nm}$) and Angstrom exponent at 440-870 nm ($AE_{440\text{-}870\ nm}$) in spring, summer, autumn, and winter, respectively. The red dashed lines represent the lognormal fit curves in (a)-(d), and the normal fit curves in (e)-(h), respectively.

Figure S3. Time series of diurnal variations of $AOD_{500\ nm}$ and $AE_{440\text{-}870\ nm}$ on (a) high AOD days, and (b) low AOD days, respectively. The solid blue lines represent $AOD_{500\ nm}$ and the solid red lines represent $AE_{440\text{-}870\ nm}$.

Figure S4. HYSPLIT backward trajectory of (a) low AOD days and (b) high AOD days.

List of tables:

Table S1. Dates are classified as low AOD days and high AOD days, respectively. Note: The fifth percentile value of the AOD daily mean is 0.02446, and days with an AOD daily mean below this value are classified as low AOD days; The 95th percentile value of the AOD daily mean is 0.14739, and days with an AOD daily mean above this value are classified as high AOD days.
