**Table S2:** Fitted model parameters ( $\pm$ SE) for the estimation of gross photosynthesis (GP) and ecosystem respiration (ER).  $A_{\max}$  is asymptotic maximum ( $\text{g CO}_2 \text{ m}^{-2} \text{ h}^{-1}$ ),  $k$  is half-saturation value ( $\mu\text{mol photon m}^{-2} \text{ s}^{-1}$ )  $n$  is average number of observations in individual model.  $R_{0_s}$  and  $R_{0_p}$  are soil respiration and plant respiration at the reference temperature at 10 °C,  $E_s$  is ecosystem sensitivity,  $b(\text{WTD})$  is coefficient for water table level. Each combination of treatment and year contains results from four plots except forage in 2021, in which one plot was discarded due to poor model performance.

\*Due to poor growth on the set-aside plots in 2019 and 2020, only a few GP measurements were made in 2020.

**Figure S1:** Comparisons between the measured and the model predicted values ( $\text{g CO}_2 \text{ m}^{-2} \text{ h}^{-1}$ ) of gross photosynthesis (GP) and ecosystem respiration (ER) for the set-aside (A) and grass (B) treatments in 2018-2022. Outliers are excluded. Black lines represent the 1:1 line and the red and blue lines linear regression between the measured and modelled values.
