The error</i>                                |          |

bars in (a), (d), and (e) represent the 95% confidence interval (using standard deviation) from the monthly mean. The data were computed based on 15-minute timestep measurements..... 10

### Subsection 3. Soil conditions in the forest inventory plots..... 11

30 **Figure S3.1.** Monthly mean soil temperature ( $^{\circ}\text{C}$ ) for different land-cover classes from April 10, 2022, to April 9, 2023. The mean values were calculated by averaging the data from two representative plots for each land-cover class. Soil sensors were installed 0.2 m below the ground. .... 11

**Figure S3.2.** Monthly mean water content ( $\text{m}^3 \text{m}^{-3}$ ) for different land-cover classes from April 10, 2022, to April 9, 2023. The mean values were calculated by averaging the data from two representative plots for each land-cover class. Soil sensors were installed 0.2 m below the ground. .... 12

35 **Figure S3.3.** Monthly mean soil saturation extraction electrical conductivity ( $\text{mS cm}^{-1}$ ) for different land-cover classes from April 10, 2022, to April 9, 2023. The mean values were calculated by averaging the data from two representative plots for each land-cover class. Soil sensors were installed 0.2 m below the ground. .... 13

### Subsection 4. Correlation matrix meteorological and soil conditions..... 14

40 **Figure S4.1.** Correlation between daily sum precipitation ('Sum prec.'; mm), daily mean air temperature ('Air temp.';  $^{\circ}\text{C}$ ), daily mean soil temperatures ('stemM';  $^{\circ}\text{C}$ ), daily mean soil water content ('swcM';  $\text{m}^3 \text{m}^{-3}$ ), daily mean soil saturation extraction electrical conductivity ('secM';  $\text{mS cm}^{-1}$ ) at Kulen from April 10, 2022, to April 9, 2023. The suffixes 'EF', 'RF', and 'CP' represent evergreen forests, regrowth forests, and cashew plantations. The precipitation and air temperature data were measured at Kulen's meteorological station (see Fig. 1); meanwhile, the soil data were the average of two measured plots in each land-cover class. .... 14

### Subsection 5. Species diversity. .... 15

45 **Table S5.1.** Percentage of shared species among land-cover classes in the nine-forest inventory plot. The "Count" column indicates the total number of species observed in each land-cover class, whereas the "Sum" column indicates the total number of species recorded in each land-cover class. The "Shared%" column indicates the proportion of each species found in each land-cover class. Within each land-cover class, the "Cumulative Sum%" column displays the cumulative sum percentage, which accumulates from the highest to the lowest percentage of shared species. .... 15

**Table S5.2.** Species richness ( $S_R$ ) and Shannon-Wiener index ( $S_H$ ) across nine forest inventory plots in Kulen, Cambodia. .... 17

### Subsection 6. Functional diversity of different land covers and plots. .... 18

50 **Table S6.1.** Summary of the leaf traits, including leaf dry weight, leaf area, leaf length, specific leaf area (SLA,  $\text{m}^2 \text{kg}^{-1}$ ), chlorophyll a and b content (Chl,  $\text{mg g}^{-1}$ ), and leaf dry matter content (LDMC,  $\text{mg g}^{-1}$ ), obtained from 30 plant woody species found in the Kulen inventory list. The table displays the number of species collected (n), the mean value, standard deviation (SD.), median, minimum (min.), and maximum (max.) value for each trait. .... 18

55 **Table S6.2.** The mean and standard deviation values (SD) of leaf chlorophyll content (SPAD-value), leaf fresh weight (g), leaf dry weight (g), leaf length area (cm), leaf area ( $\text{cm}^2$ ), specific leaf area (SLA,  $\text{m}^2 \text{kg}^{-1}$ ), chlorophyll a and b content (Chl,  $\text{mg g}^{-1}$ ), and leaf dry matter content (LDMC,  $\text{mg g}^{-1}$ ) by species. The data included all 30 plant woody species from inventory data species which was used to compute the community weighted mean for SLA, Chl and LDMC. 'n' is the total number of sample leaves per species. \*Standard deviation values include both the standard deviation of five-time measurements per leaf and the standard deviation of the total number of leaves sampled per species. .... 18

**Table S6.3.** The values of specific leaf area (SLA,  $\text{m}^2 \text{kg}^{-1}$ ), chlorophyll a and b content (Chl,  $\text{mg g}^{-1}$ ), and leaf dry matter content (LDMC,  $\text{mg g}^{-1}$ ) by species and inventory plots. The samples were collected from cashew plantations (CP), regrowth forests (RF), evergreen forests (EF), and the areas within 500 m of EF and RF plots (EF123 and RF123). In the SLA, Chl, and LDMC columns, 'n' = the number of leaf samples, 'Mean' = the mean value, and 'SD' = the standard deviation value. .... 19

|    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |           |
|----|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------|
| 60 | <b>Table S6.4.</b> Woody species trait value sources and their shared percentages by plot of the data used to compute community weighted mean (CWM). In the column "Trait data source", the value "Plot" is species trait values derived directly from the species collected in its plot, "LC" value is species trait values obtained from its land-cover class when the trait species was not collected in its plot, and "Pool" value is trait values obtained from other land covers in Kulen; The column "Count" indicates the shared number of tree stands in the plot; "Total" is the total number of trees in the plot; and "Shared %" is the shared percentage of trees with different trait sources. "n. missing species" column is the number of missing species in each plot; the "Species" column contains the missing species in each plot. Seedlings were not included in this figure as they do not have DBH records and are not used in community weighted-mean calculations. ....       | 21        |
| 65 | <b>Subsection 7. Stand structure of different land-cover classes and plots.....</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | <b>23</b> |
|    | <b>Figure S7.1.</b> The frequency distributions of tree diameters at the breast height (DBH, cm) and height (H, m) across different plots. The plot labels "EF", "RF", and "CP" correspond to "evergreen forests", "regrowth forests" and "cashew plantations" respectively. ....                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | 23        |
|    | <b>Table S7.1.</b> Distribution of stem density per hectare by DBH class for different land-cover classes. EF, RF, and CP stand for evergreen forests, regrowth forests, and cashew plantations. ....                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | 24        |
| 70 | <b>Table S7.2.</b> Distribution of aboveground biomass (AGB) across diameter at breast height (DBH) classes for different land-cover classes. The total AGB estimated by $AGB_f$ method was used in the calculation. EF, RF and CP stand for evergreen forests, regrowth forests, and cashew plantations. ....                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | 24        |
|    | <b>Table S7.3.</b> Descriptive statistics of observed leaf area index (LAI) ( $m^2 m^{-2}$ ) measured at breast height and ground height for evergreen forests (EF), regrowth forests (RF), and cashew plantations (CP) by different months of a year. The "Month" column represents the months of the year (1 = January and 12 = December). The "n" column indicates the number of measurements in a specific month for each land cover. ....                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | 25        |
| 75 | <b>Table S7.4.</b> Ordinary least square regression statistical table of between diameter at breast height $\ln(DBH)$ (cm) and height $\ln(H)$ (m) for evergreen forests (EF), regrowth forests (RF), and cashew plantations (CP) in Kulen. ....                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | 26        |
|    | <b>Figure S7.2.</b> Relationship between diameter at breast height $\ln(DBH)$ (cm) and height $\ln(H)$ (m) for different inventory plots in evergreen forests (EF), regrowth forests (RF), and cashew plantations (CP) in Kulen. In (a), (b) and (c) present $\ln(DBH)$ (cm) and $\ln(H)$ (m) relationships at plots EF1, EF2, and EF3 of the evergreen forests; In (d), (e) and (f) present $\ln(DBH)$ (m) and $\ln(H)$ (m) relationships at plots RF1, RF2, and RF3 of regrowth forests; in (g), (h) and (i) present DBH (cm) and H (m) relationships at plots CP1, CP2, and CP3 of cashew plantation. Based on the relationship below, the intercept parameter ( $K_1$ ) and slop parameter ( $K_2$ ) of the power law relationship between DBH (cm) and H (m) for each plot were obtained. The $K_1$ and $K_2$ parameters were used as community traits to investigate the relationship among other biodiversity and ecosystem property variables of various land-cover classes by plot level. .... | 27        |

## Subsection 1. Characteristics of the forest inventory plots.

115

**Figure S1.1.** Photographs of the forest inventory plots in Phnom Kulen National Park. (a), (b), and (c) are the evergreen forest plots at the south (EF1), middle (EF2), and north (EF3); (e), (f) and (g) are the regrowth forest plots at the south (RF1), middle (RF2), and north (RF3). (h), (j) and (k) are the cashew plantation plots at the south (CP1), middle (CP2), and north (CP3).

**Figure S1.2.** Design of forest inventory plots and sub-plots.

125 **Table S1.1.** Description of the decomposition level used to record lying and standing deadwood decomposition in this study. The proposed five-scale level of decomposition was modified based on a harmonizing scaling system between the Swedish National Forest Inventory (Swedish NFI, 2019) and the Cambodian National Forest Inventory (Than et al., 2018).

| Proposed in this study |       |                                                                                                                                                                                                                                | Cambodian NFI |                                |       | Swedish NFI                                                                                                                                                                                                                 |  |

145 **Figure S2.2.** Monthly meteorological conditions at Kulen meteorological station from April 10, 2022, to April 9, 2023. (a) Monthly average air temperature ( $^{\circ}\text{C}$ ); (b) Monthly total precipitation (mm); (c) Monthly total global radiation ( $\text{W m}^{-2}$ ); (d) Monthly average relative humidity (%); (e) Monthly average wind speed ( $\text{m s}^{-1}$ ). The error bars in (a), (d), and (e) represent the 95% confidence interval (using standard deviation) from the monthly mean. The data were computed based on 15-minute timestep measurements.

**Figure S3.1.** Monthly mean soil temperature (°C) for different land-cover classes from April 10, 2022, to April 9, 2023. The mean values were calculated by averaging the data from two representative plots for each land-cover class. Soil sensors were installed 0.2 m below the ground.

**Figure S3.2.** Monthly mean water content ( $\text{m}^3 \text{m}^{-3}$ ) for different land-cover classes from April 10, 2022, to April 9, 2023. The mean values were calculated by averaging the data from two representative plots for each land-cover class. Soil sensors were installed 0.2 m below the ground.

**Figure S3.3.** Monthly mean soil saturation extraction electrical conductivity ( $\text{mS cm}^{-1}$ ) for different land-cover classes from April 10, 2022, to April 9, 2023. The mean values were calculated by averaging the data from two representative plots for each land-cover class. Soil sensors were installed 0.2 m below the ground.

Subsection 4. Correlation matrix meteorological and soil conditions.

**Figure S4.1.** Correlation between daily sum precipitation (‘Sum prec.’; mm), daily mean air temperature (‘Air temp.’; °C), daily mean soil temperatures (‘stemM’; °C), daily mean soil water content (‘swcM’; m<sup>3</sup> m<sup>-3</sup>), daily mean soil saturation extraction electrical conductivity (‘secM’; mS cm<sup>-1</sup>) at Kulen from April 10, 2022, to April 9, 2023. The suffixes ‘EF’, ‘RF’, and ‘CP’ represent evergreen forests, regrowth forests, and cashew plantations. The precipitation and air temperature data were measured at Kulen’s meteorological station (see Fig. 1); meanwhile, the soil data were the average of two measured plots in each land-cover class.

## Subsection 5. Species diversity.

**Table S5.1.** Percentage of shared species among land-cover classes in the nine-forest inventory plot. The "Count" column indicates the total number of species observed in each land-cover class, whereas the "Sum" column indicates the total number of species recorded in each land-cover class. The "Shared%" column indicates the proportion of each species found in each land-cover class. Within each land-cover class, the "Cumulative Sum%" column displays the cumulative sum percentage, which accumulates from the highest to the lowest percentage of shared species.

| N  | Forest type      | Species                          | Family           | Count | Sum | Shared % | Cumulative sum % |
|----|------------------|----------------------------------|------------------|-------|-----|----------|------------------|
| 1  | Evergreen forest | Mesua ferrea                     | Calophyllaceae   | 18    | 136 | 13.24    | 13.24            |
| 2  | Evergreen forest | Diospyros bejaudii               | Ebenaceae        | 12    | 136 | 8.82     | 22.06            |

190 **Subsection 6. Functional diversity of different land covers and plots.**

**Table S6.1.** Summary of the leaf traits, including leaf dry weight, leaf area, leaf length, specific leaf area (*SLA*, m<sup>2</sup> kg<sup>-1</sup>), chlorophyll a and b content (*Chl*, mg g<sup>-1</sup>), and leaf dry matter content (*LDMC*, mg g<sup>-1</sup>), obtained from 30 plant woody species found in the Kulen inventory list. The table displays the number of species collected (*n*), the mean value, standard deviation (*SD*.), median, minimum (*min.*), and maximum (*max.*) value for each trait.

195

200 **Table S6.2.** The mean and standard deviation values (*SD*) of leaf chlorophyll content (*SPAD*-value), leaf fresh weight (g), leaf dry weight (g), leaf length area (cm), leaf area (cm<sup>2</sup>), specific leaf area (*SLA*, m<sup>2</sup> kg<sup>-1</sup>), chlorophyll a and b content (*Chl*, mg g<sup>-1</sup>), and leaf dry matter content (*LDMC*, mg g<sup>-1</sup>) by species. The data included all 30 plant woody species from inventory data species which was used to compute the community weighted mean for *SLA*, *Chl* and *LDMC*. ‘*n*’ is the total number of sample leaves per species. \* Standard deviation values include both the standard deviation of five-time measurements per leaf and the standard deviation of the total number of leaves sampled per species.

| N. | Species                   | <i>n</i> | <i>Chl</i> ( <i>SPAD</i> ) |      | Fresh weight (g) |      | Dry weight (g) |      | Leaf length (cm) |      | Leaf area (cm <sup>2</sup> ) |       | <i>SLA</i> (m <sup>2</sup> kg <sup>-1</sup> ) |       | <i>Chl</i> (mg g <sup>-1</sup> ) |      | <i>LDMC</i> (mg g <sup>-1</sup> ) |        |

205 **Table S6.3.** The values of specific leaf area (*SLA*, m<sup>2</sup> kg<sup>-1</sup>), chlorophyll a and b content (*Chl*, mg g<sup>-1</sup>), and leaf dry matter content (*LDMC*, mg g<sup>-1</sup>) by species and inventory plots. The samples were collected from cashew plantations (CP), regrowth forests (RF), evergreen forests (EF), and the areas within 500 m of EF and RF plots (EF123 and RF123). In the *SLA*, *Chl*, and *LDMC* columns, ‘n’ = the number of leaf samples, ‘Mean’ = the mean value, and ‘SD’ = the standard deviation value.

**Table S6.4.** Woody species trait value sources and their shared percentages by plot of the data used to compute community weighted mean (CWM). In the column "Trait data source", the value "Plot" is species trait values derived directly from the species collected in its plot, "LC" value is species trait values obtained from its land-cover class when the trait species was not collected in its plot, and "Pool" value is trait values obtained from other land covers in Kulen; The column "Count" indicates the shared number of tree stands in the plot; "Total" is the total number of trees in the plot; and "Shared %" is the shared percentage of trees with different trait sources. "n. missing species" column is the number of missing species in each plot; the "Species" column contains the missing species in each plot. Seedlings were not included in this figure as they do not have *DBH* records and are not used in community weighted-mean calculations.

## Subsection 7. Stand structure of different land-cover classes and plots.

225 **Figure S7.1.** The frequency distributions of tree diameters at the breast height (*DBH*, cm) and height (*H*, m) across different plots. The plot labels “EF”, “RF”, and “CP” correspond to “evergreen forests”, “regrowth forests” and “cashew plantations” respectively.

**Table S7.1.** Distribution of stem density per hectare by *DBH* class for different land-cover classes. EF, RF, and CP stand for evergreen forests, regrowth forests, and cashew plantations.

| N. | Land cover | <i>DBH</i><br>Class<br>(cm) | Mean    | SD     | Min     | Max     | Sum     | Shared percentage of<br>number of stems |
|----|------------|-----------------------------|---------|--------|---------|---------|---------|-----------------------------------------|
| 1  | EF (n = 3) | 5–15                        | 800.00  | 435.89 | 500.00  | 1300.00 | 2400.00 | 78.72%                                  |
| 2  | EF (n = 3) | 15–30                       | 162.95  | 130.20 | 66.66   | 311.08  | 488.84  | 16.03%                                  |
| 3  | EF (n = 3) | 30–100                      | 53.36   | 30.57  | 20.01   | 80.04   | 160.08  | 5.25%                                   |
| 4  | RF (n = 3) | 5–15                        | 2133.33 | 945.16 | 1400.00 | 3200.00 | 6400.00 | 97.30%                                  |
| 5  | RF (n = 3) | 15–30                       | 59.25   | 51.31  | 0       | 88.88   | 177.76  | 2.70%                                   |
| 6  | CP (n = 3) | 5–15                        | 933.33  | 450.92 | 500.00  | 1400.00 | 2800.00 | 87.50%                                  |
| 7  | CP (n = 3) | 15–30                       | 133.32  | 58.79  | 88.88   | 199.98  | 399.96  | 12.50%                                  |

**Table S7.2.** Distribution of aboveground biomass (*AGB*) across diameter at breast height (*DBH*) classes for different land-cover classes. The total *AGB* estimated by *AGB<sub>f</sub>* method was used in the calculation. EF, RF and CP stand for evergreen forests, regrowth forests, and cashew plantations.

| N. | Land cover | <i>DBH</i> class (cm) | Mean $\pm$ SD (Mg ha <sup>-1</sup> ) | Range (Mg ha <sup>-1</sup> ) | Mean <i>AGB<sub>f</sub></i> (Mg ha <sup>-1</sup> ) | Shared percentage of <i>AGB<sub>f</sub></i> |
|----|------------|-----------------------|--------------------------------------|------------------------------|----------------------------------------------------|---------------------------------------------|

**Table S7.3.** Descriptive statistics of observed leaf area index (*LAI*) ( $\text{m}^2 \text{m}^{-2}$ ) measured at breast height and ground height for evergreen forests (EF), regrowth forests (RF), and cashew plantations (CP) by different months of a year. The "Month" column represents the months of the year (1 = January and 12 = December). The "n" column indicates the number of measurements in a specific month for each land cover.

| N. | Land cover | Month | <i>LAI<sub>T</sub></i> ( $\text{m}^2 \text{m}^{-2}$ ) |      |      |        |      |      | <i>LAI<sub>C</sub></i> ( $\text{m}^2 \text{m}^{-2}$ ) |      |      |        |      |      |

**Figure S7.2.** Relationship between diameter at breast height  $\ln(DBH)$  (cm) and height  $\ln(H)$  (m) for different inventory plots in evergreen forests (EF), regrowth forests (RF), and cashew plantations (CP) in Kulen. In (a), (b) and (c) present  $\ln(DBH)$  (cm) and  $\ln(H)$  (m) relationships at plots EF1, EF2, and EF3 of the evergreen forests; In (d), (e) and (f) present  $\ln(DBH)$  (m) and  $\ln(H)$  (m) relationships at plots RF1, RF2, and RF3 of regrowth forests; in (g), (h) and (i) present

255

*DBH* (cm) and *H* (m) relationships at plots CP1, CP2, and CP3 of cashew plantation. Based on the relationship below, the intercept parameter ( $K_1$ ) and slop parameter ( $K_2$ ) of the power law relationship between *DBH* (cm) and *H* (m) for each plot were obtained. The  $K_1$  and  $K_2$  parameters were used as community traits to investigate the relationship among other biodiversity and ecosystem property variables of various land-cover classes by plot level.

**Table S7.5.** The computed values of the intercept parameter ( $K_1$ ) and slop parameter ( $K_2$ ) of power-law relationship between diameter at breast height (*DBH*) (cm) and height (*H*) (m) for each plot.

| N | Land-cover class       | Plot ID | $K_1$ | $K_2$ |
|---|------------------------|---------|-------|-------|
| 1 | Evergreen forest (EF)  | EF1     | 2.583 | 0.710 |
| 2 | EF                     | EF2     | 2.100 | 0.727 |
| 3 | EF                     | EF3     | 2.586 | 0.694 |
| 4 | Regrowth forest (RF)   | RF1     | 2.270 | 0.713 |
| 5 | RF                     | RF2     | 2.512 | 0.666 |

**Figure S7.3.** The 1:1 line plot comparison between aboveground biomass (*AGB*, kg) estimated by the diameter at breast height (*DBH*) and height (*H*) relationship ( $AGB_h$ , kg) and aboveground biomass estimated by adopted functions ( $AGB_f$ , kg) for evergreen forests (EF) (a), regrowth forests (RF) (b), and cashew plantations (CP) (c).

**Figure S7.4.** The estimation of aboveground biomass ( $AGB$ ) ( $\text{Mg ha}^{-1}$ ) by different methods for each inventory plot. “ $AGB_f$ ” represents aboveground biomass estimated by adopted functions; “ $AGB_{wd}$ ” represents aboveground biomass estimated by adopted functions utilizing species-specific wood density; “ $AGB_h$ ” represents aboveground biomass estimated by the diameter at breast height ( $DBH$ ) and height ( $H$ ) relationship, along with species-specific wood density, for our study site.

**Figure S7.5.** The 1:1 line plot comparison between aboveground biomass estimated by diameter at breast height ( $DBH$ ) and height ( $H$ ) relationship ( $AGB_h$ ) and aboveground biomass estimated by adopted functions ( $AGB_f$ ) for evergreen forest plots (EF1, EF2, and EF3) (a, b, and c), regrowth forest plots (RF1, RF2, and RF3) (d, e, and f), and cashew plantation plots (CP1, CP2, CP3) (g, h, and i).

## Subsection 8. Relationships among ecosystem characteristics.

**Table S8.1.** Ordinary least squares regression model fit statistics for  $\ln(AGB_h)$  and  $\ln(S_R)$ ,  $\ln(AGB_h)$  and  $\ln(LAI_T)$ , and  $\ln(AGB_h)$  and  $\ln(SLA_{cwm})$ . The number of observations is the number of plots. ‘ $LAI_T$ ’ is a mean of total leaf area index, ‘ $AGB_h$ ’ is aboveground biomass, ‘ $SLA_{cwm}$ ’ is a community-weighted mean.

285 **Figure S8.1.** The relationship between biodiversity and ecosystem property variables of different land-cover classes in Kulen. ‘EF’, ‘RF’, and ‘CP’ are evergreen forests, regrowth forests and cashew plantations. The suffixes ‘1’, ‘2’, and ‘3’ are plot ID. The variables: ‘Mean *LAI*’ means *LAI* measured at the ground level ( $\text{m}^2 \text{m}^{-2}$ ), ‘*SLA<sub>cwm</sub>*’ is community weighted mean of specific leaf area ( $\text{kg m}^{-2}$ ), and ‘Species richness’ is the counted number of species in each sample plot. ‘*K<sub>1</sub>*’ and ‘*K<sub>2</sub>*’ are the intercept and slope of the relationship between *H* and *DBH* at plot level (unitless). ‘*AGB*’ is aboveground biomass ( $\text{Mg ha}^{-1}$ ) computed based on the relationship between *DBH* and *H* (*AGB<sub>h</sub>*).

## Subsection 9. Comparison of species richness, Shannon-Wiener index and *LAI* with previous studies.

**Table S9.1.** Comparison of species richness ( $S_R$ ) with previous studies.

| Region                         | Forest type                          | Species richness<br>(species per ha)                     | Methods                                               | References               |
|--------------------------------|--------------------------------------|----------------------------------------------------------|-------------------------------------------------------|--------------------------|
| Kulen, Cambodia                | Old-growth tropical evergreen forest | 87 (13 species per plot)                                 | Excluding seedling species, 3 plots, each 30 m x 50 m | In this study            |
| Kulen, Cambodia                | Old-growth tropical evergreen forest | 113 (17 species per plot)                                | Including seedling species, 3 plots, each 30 m x 50 m | In this study            |
| Kulen, Cambodia                | Regrowth evergreen forest            | 67 (10 species per plot)                                 | Excluding seedling species, 3 plots, each 30 m x 50 m | In this study            |
| Kulen, Cambodia                | Regrowth evergreen forest            | 87 (13 species per plot)                                 | Including seedling species, 3 plots, each 30 m x 50 m | In this study            |
| Central plains in Cambodia     | Various tropical forest types        | ~50-110 (Estimated based on species accumulation curves) | $DBH > 10$ , 119 plots, each 50 m x 10 m              | Theilade et al. (2022)   |
