**Figure S1.** Screened results for the years 2012 and 2021 using the modified VM criteria, in which  $\alpha$  in the equation  $([O_3]_i - \overline{[O_3]}) < \alpha \cdot \sigma$  is set to -0.8. The blue curve represents the hourly time series of the ozone mixing ratio, and the red dots denote the ODE hours identified by the criterion.

**Figure S2.** Number of ODE hours identified by each criterion from 2000 to 2022. VM( $\alpha = -1.5$ ) denotes that  $\alpha$  in the equation  $([O_3]_i - \overline{[O_3]}) < \alpha \cdot \sigma$  is set to -1.5, and VM( $\alpha = -0.8$ ) denotes that  $\alpha$  is set to -0.8.

**Figure S3.** Yearly variability of the ODE hours at the BRW station, identified by two criteria with different constant thresholds (5 ppbv and 4 ppbv). Subplots (a), (c), (e) and (g) show the ODE hours screened by the TM1-5 ppbv method for the whole spring, March, April and May, respectively, and subplots (b), (d), (f) and (h) show the hours screened by the TM1-4 ppbv method. Red dashed lines represent linear regressions of the ODE hours. The regression equations and p-values are also given.

(a) Spring

(b) ODE hours (TM1)

(c) ODE hours (TM1-5 ppbv)

(d) ODE hours (TM1-4 ppbv)

**Figure S4.** Wind rose diagrams during (a) the investigated spring seasons from 2000 to 2022, and ODE time periods identified by (b) TM1, (c) TM1-5 ppbv and (d) TM1-4 ppbv.
