Figure SI 1: Field cropping history for the arable control, and regenerative blackcurrant fields (2014-2021). Discrete Boxes represent one full cropping cycle and where applicable re-planting of new bushes.

Table SI 1: Soil texture classification and relative proportion of sand, NWSA and WSA (%) (n=5) of alley (white) and bush (grey) regimes with increasing years of establishment. Error bars represent \pm 1SD. For a given regime (alley or bush) dissimilar lower-case letters indicate significant ($p \le 0.05$) differences across the timeseries. At a given timepoint, the * indicates a significant difference ($p \le 0.05$), between the alley and bush regimes, ** indicates a significant difference ($p \le 0.01$), between the alley and bush regimes.

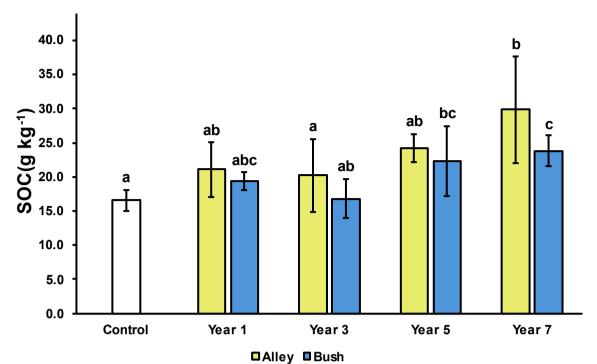

Figure SI2: SOC (n=5) of alley (yellow) and bush (blue) regimes with increasing years of establishment. Error bars represent \pm 1SD. For a given regime (alley or bush) dissimilar lower-case letters indicate significant (p ≤ 0.05) differences across the timeseries. At a given timepoint, * indicates a significant difference (p < 0.05) between the alley and bush regimes.

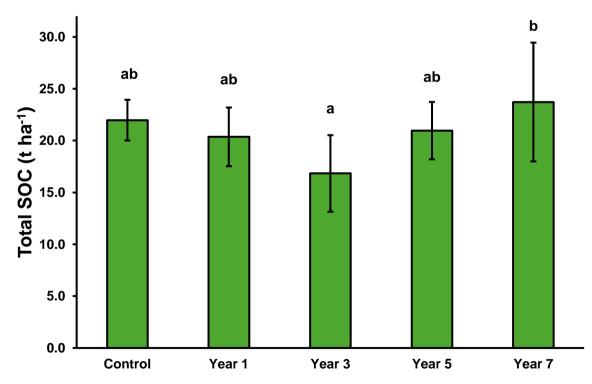

Figure SI 3: Total carbon field stocks (n=5), Error bars represent + 1SD. Dissimilar lower-case letters indicate significant ($p \le 0.05$) differences across the timeseries
