1 Supplementary

The supplementary material of this study provides essential additional information for a deeper understanding of the results presented in the main article. It includes detailed reconstructions of the South American biomes, highlighting the main classifications; Additionally, figures illustrating the spatial distribution of the mean seasonal differences in sea level pressure (SLP) between interglacial experiments, compared with sea surface temperature (SST) and precipitation from the control experiment (CTRL), are presented. The differences are shown for the MH-CTRL, MIS5e-CTRL, MIS11c-CTRL and MIS31-CTRL periods, highlighting statistically significant anomalies at the 95% confidence level; Finally, analyses of the Hadley circulation based on the summer (DJFM) and winter (JJAS) composite anomalies are also included, showing the differences between the MH-CTRL, MIS5e-CTRL and MIS11c-CTRL experiments. The figures use maps of meridional mass stream functions, with contour intervals representing fluxes.

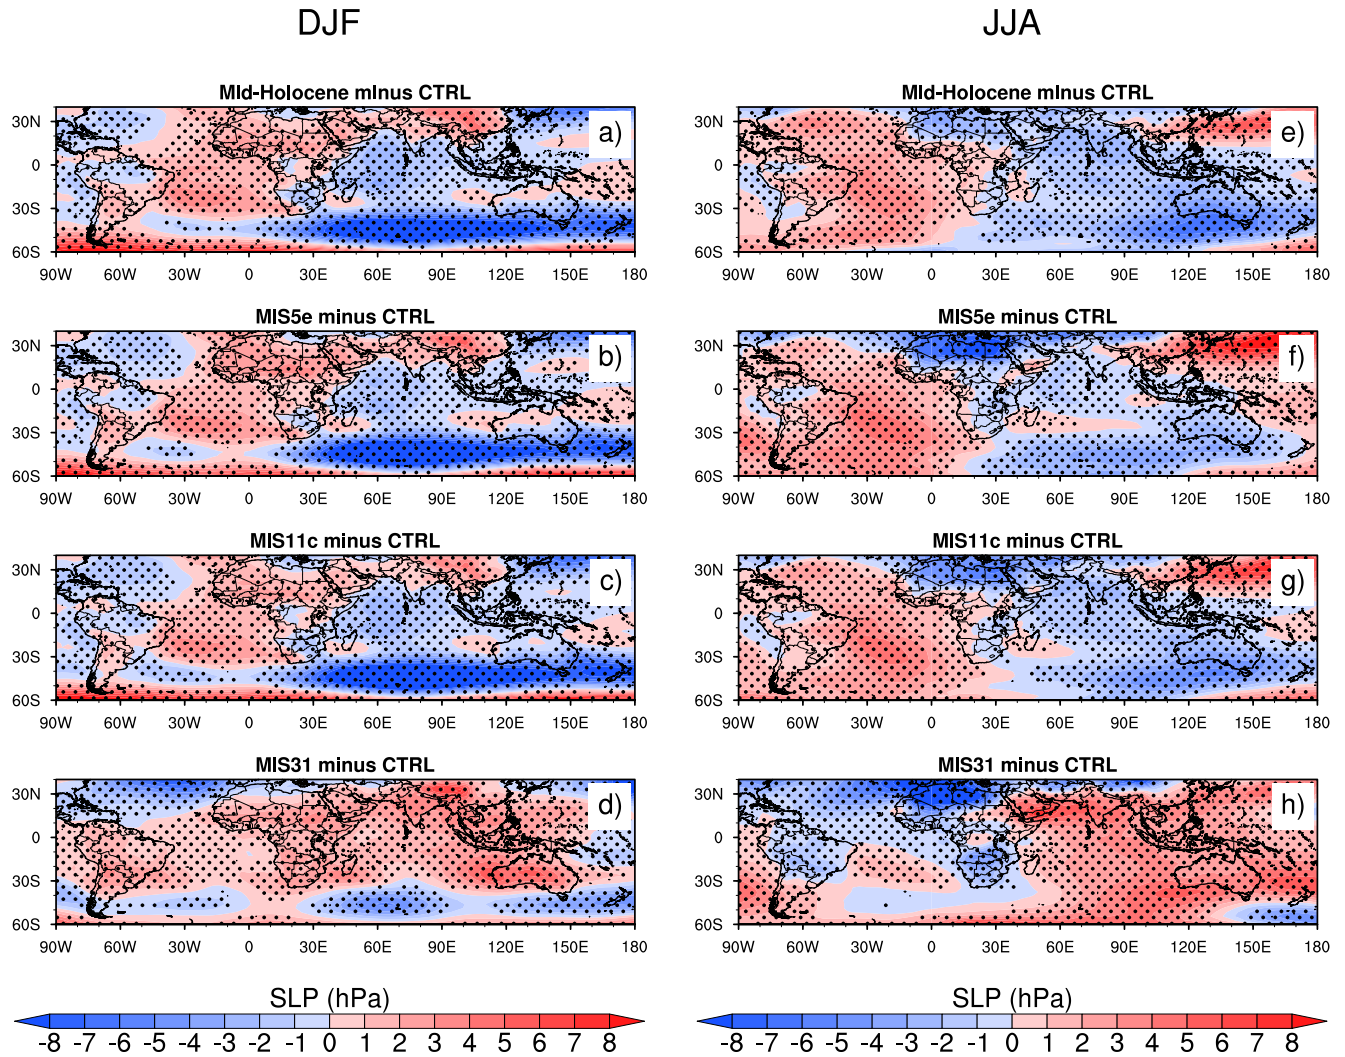

Figure S1. Spatial distribution of season (DJF and JJA) mean surface SLP difference between interglacials experiments compared to SST and precipitation from CTRL; MH minus CTRL (a,e), MIS5e minus CTRL (b,f), MIS11c minus CTRL (c,g) and MIS31 minus CTRL (d,h). Black dots represent correspond to statistically significant anomalies at the 95% confidence interval.

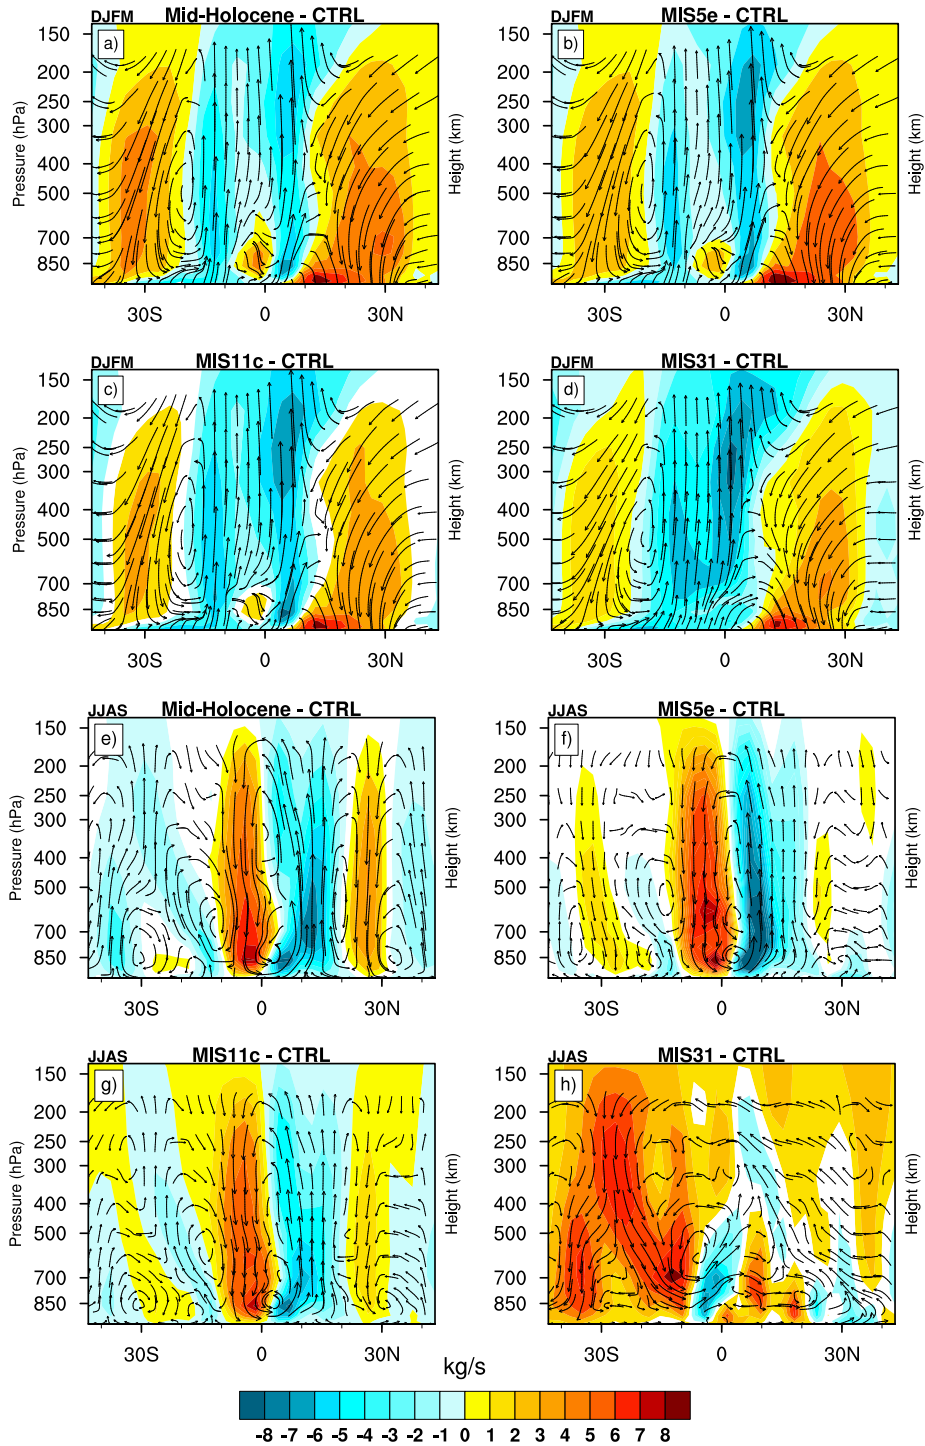

Figure S2. Hadley circulation from the difference between summer (DJFM) composite anomalies MH-CTRL (a), MIS5e-CTRL (b), MIS11c-CTRL (c) and MIS5e-CTRL (d); and winter (JJAS) MH-CTRL (e), MIS5e-CTRL (f), MIS11c-CTRL (g) and MIS5e-CTRL (h). Color bar indicates the value of mass stream function of mean meridional circulation. The contours intervals represents 10^9 kg/s.

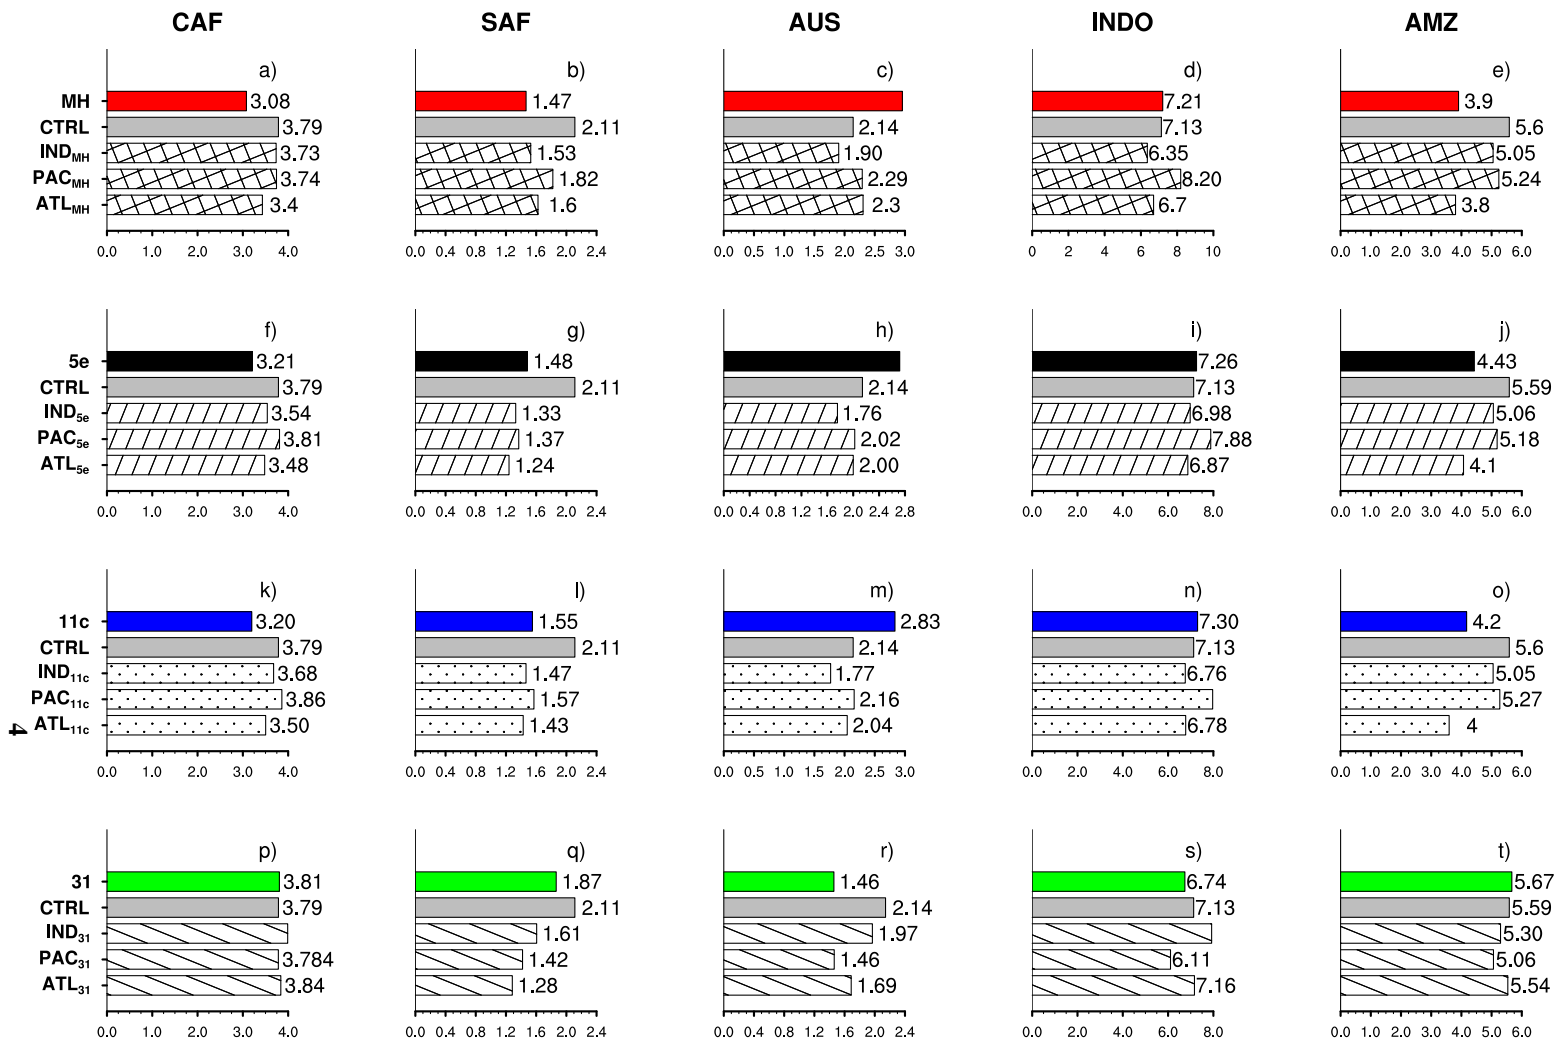

Figure S3. Areal averaged precipitation (mm/day) CAF, SAF, AUS, IND and AMZ, region for the SST sensitivity experiments.

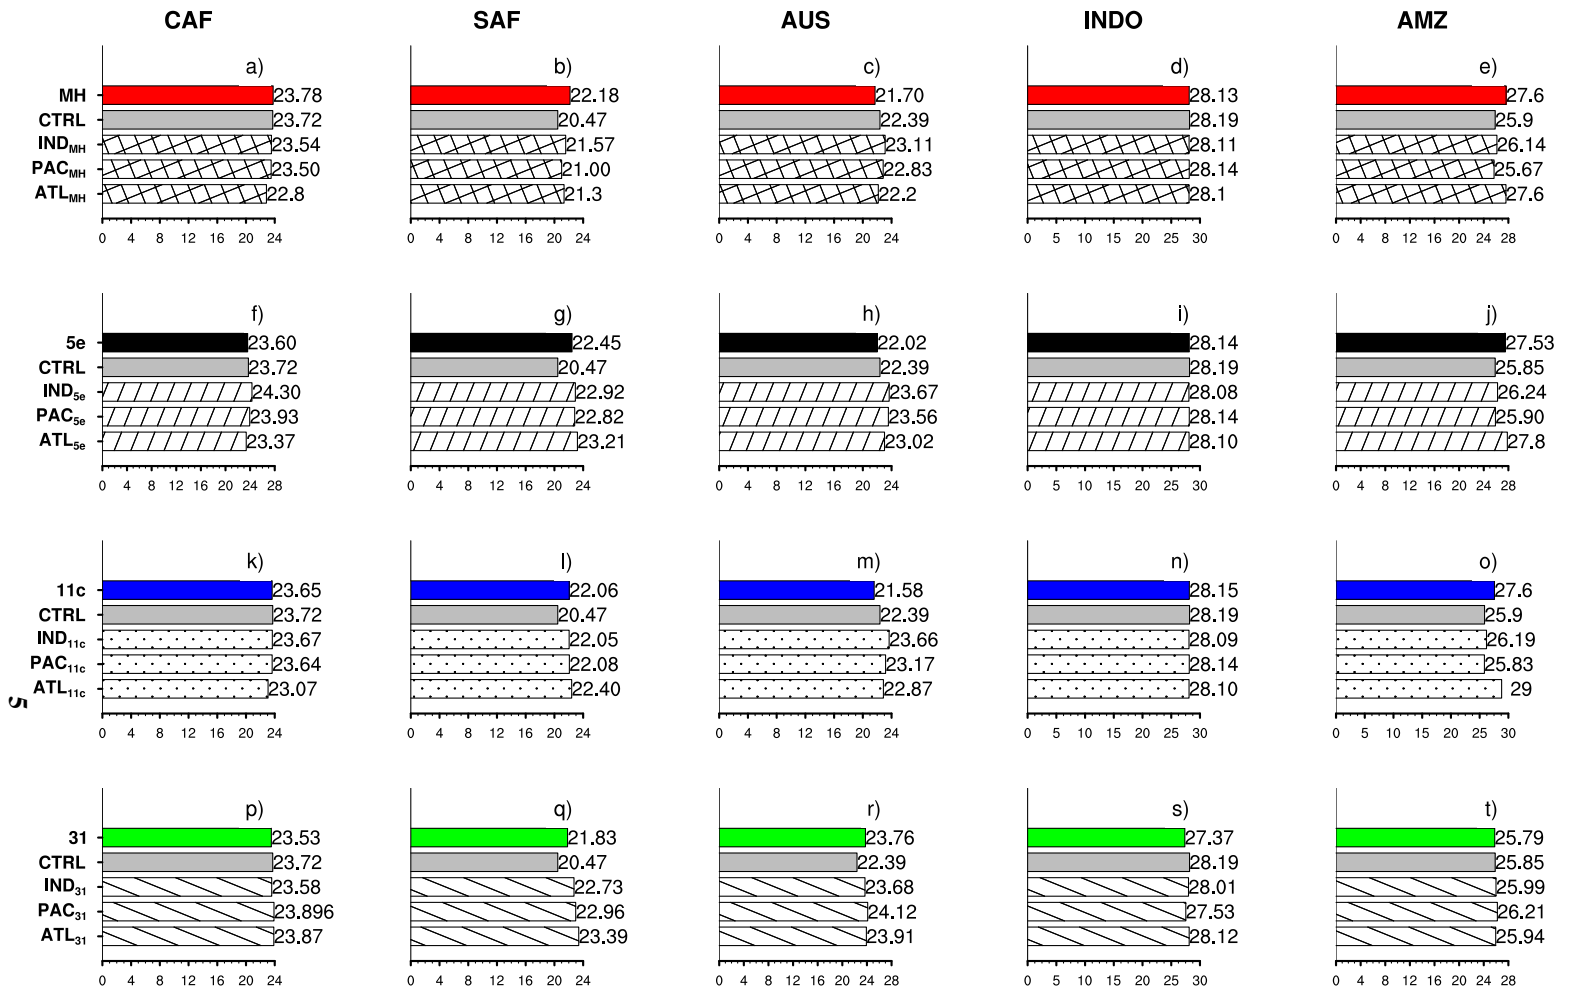

Figure S4. Areal averaged temperature (mm/day) CAF, SAF, AUS, IND and AMZ, region for the SST sensitivity experiments.

Table S1. Correlation coefficients of mean time series between the Niño3.4 index and the precipitations over areas of the tropical regional. Bold values indicate statistical significance at the 95% level.

	MH	MIS5e	MIS11c	MIS31
Austral Summer (DJFM)				
Index		Niño ₃₄		
Precipitation Domain				
CAF	-0.39	-0.24	0.34	0.12
SAF	-0.24	-0.12	-0.11	0.13
AUS	-0.35	-0.1	0.17	-0.47
INDO	-0.23	-0.14	0.29	-0.25
AMZ	-0.19	-0.13	-0.1	0.17

Table S2: Biome reconstructed for South America. Code biome: TRFO (Tropical rainforest); TSFO (Tropical seasonal forest); TDFO (Tropical dry forest); WTRF (Warm temperate rainforest); WEFO (Warm temperate evergreen broadleaf forest); CTRF (Cool temperate rainforest); WAMF (Warm temperate mixed forest); COMI (Cool mixed forest); CGSS (Cool grasslands); STEP (Steppe); DESE (Desert); CGSH (Cool grass shrublands).
