Abstract. Indigenous knowledge can record scientific observations of specific “places” that may be difficult to preserve in the geologic record. Such place in “place-based” science highlights issues local to a learner for engaging audiences with the scientific problems relevant to their communities. Here, we focus on a popular seafaring repertoire of indigenous Ryukyuan classical music, called Nubui Kuduchi and Kudai Kuduchi, to examine place-based observations of 18th-century climate and geology in the Ryukyu Islands (21st-century Okinawa Prefecture, Japan). By comparing the environmental conditions recorded in these songs with those of 20th–21st-century studies, we find that surface winds, ocean currents, typhoons, and volcanism from lyrics parallel their respective observations in the scientific record. This novel perspective of art and science highlights the relevance of Ryukyuan classical music in teaching contemporary issues such as climate change and natural hazards. Thus, Ryukyuan indigenous knowledge can play an innovative role in science engagement for 21st-century Okinawans in Okinawa Prefecture and their diasporic kinsfolk worldwide.

1 Introduction

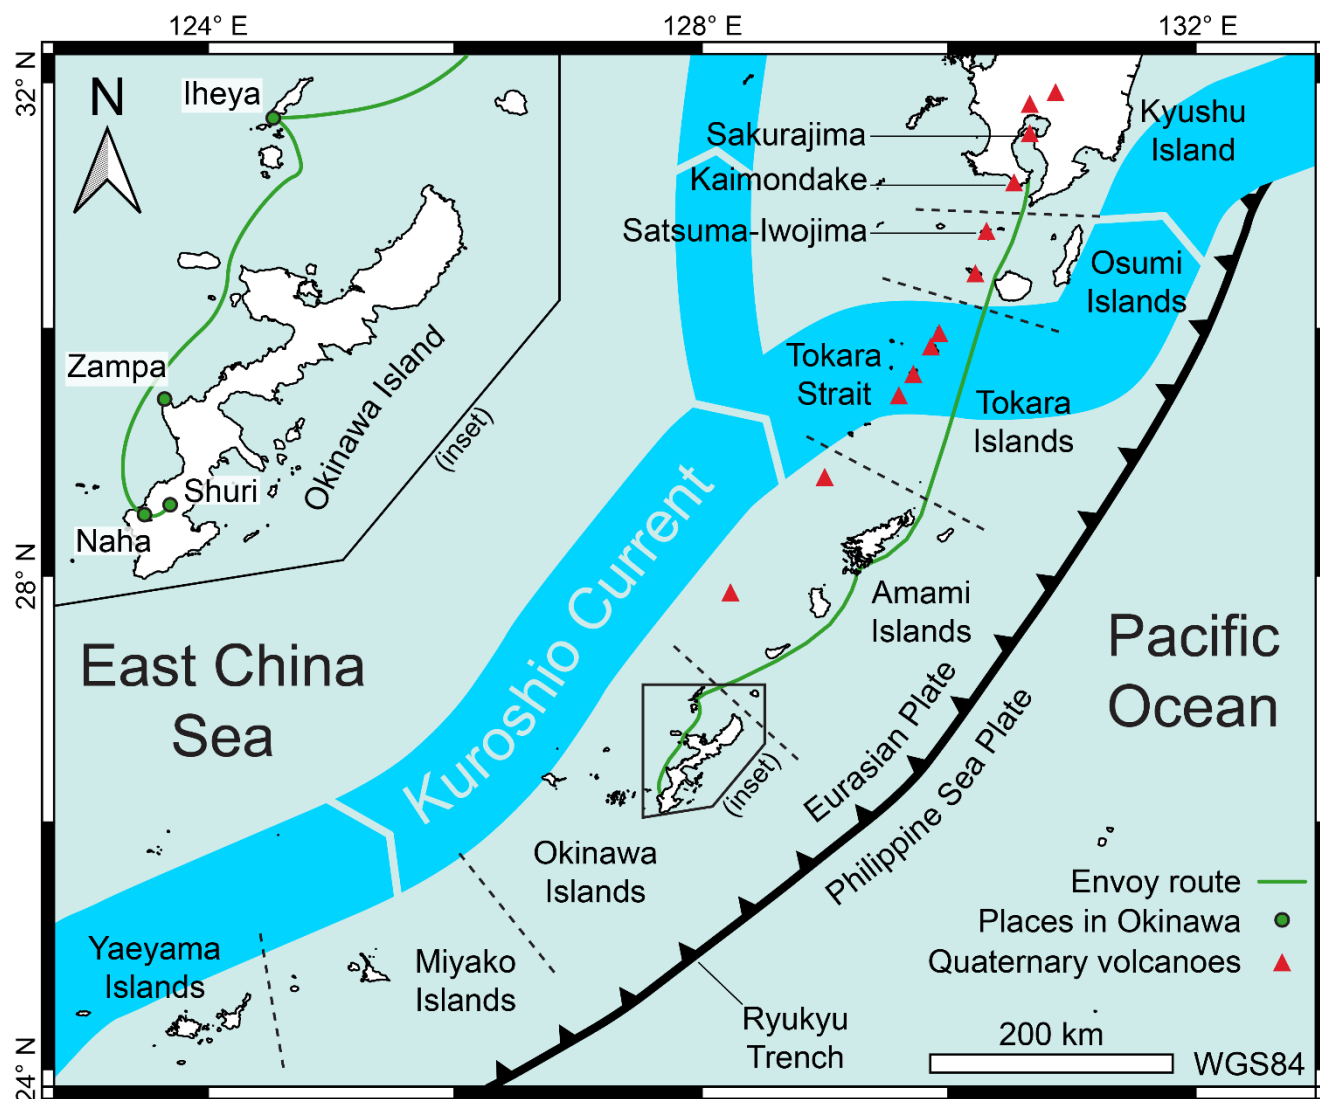

Indigenous knowledge can preserve geologic histories that are difficult to infer from the geologic records, thus guiding modern scientific inquiry. However, it was not until the 1990s-late 20th century that researchers began incorporating such untapped data in natural-environmental science literature (e.g., climate science; Petzold et al., 2020). Indigenous knowledge of plant, and animal, and weather cycles from traditional agriculture or elder knowledge have since been examined for signals of climate change and fortifications against climate hazards (e.g., Harmon et al., 2021; Hinzman et al., 2005; Hiwasaki et al., 2015; Turner and Reid, 2022). Workers also utilized Indigenous oral histories (e.g., Cascadia earthquakes in Ludwin et al., 2005), written records (e.g., Hawaiian hurricanes in Businger et al., 2018), and other sources of Indigenous gray knowledge (e.g., various hazards of Aotearoa New Zealand in Bailey-Winiata et al., 2024) to geologic improve modern-day disaster preparedness (e.g., Bailey-Winiata et al., 2024). Notably, Of note, collaborations between scientists and cultural practitioners have focused on Indigenous visual and performing arts and visual arts to examine historical historical records of volcanic activity (Swanson, 2008), earthquakes (Hough, 2007; Ludwin et al., 2005), and ecological resources (Gibson and Puniwai, 2006; Turner and Reid, 2022). Expanding the scientific analyses of artistic

30 traditions ~~to to~~ more ~~underrepresented~~ Indigenous cultures can increase research scientific objectivity and creativity by
 31 introducing new questions ~~may from~~ these ~~marginalized~~ marginalized viewpoints (Bang et al., 2018; Intemann, 2009). Thus,
 32 cAs such continued efforts in geoscience to incorporate Indigenous knowledge from art have great potential to 1) document
 33 more historical records of climate and geological phenomena, 2) jumpstart new collaborations between cultural practitioners
 34 and geoscientists, and 3) diversify scientific ways of knowing through the integration of Indigenous traditions.
 35 _____ These works have linked indigenous knowledge from oral histories, elder knowledge, and gray literature with
 36 observable processes such as permafrost loss (e.g., Hinzman et al., 2005), seasonal plant cycles (e.g., Turner and Reid,
 37 2022), sea level rise (e.g., Harmon et al., 2021; Hiwasaki et al., 2015), and a suite of natural hazards (e.g., Bailey Winiata et
 38 al., 2024; Businger et al., 2018; King and Goff, 2010; Ludwin et al., 2005; Swanson, 2008). In addition to research,
 39 hHighlighting Iindigenous knowledge within a “place-based” framework allows educators and students to better engage with
 40 the environmental geosciences by tapping personal ~~and familiar~~ experiences of specific “places” in from their local, natural
 41 world (Semken et al., 2017). For example, ~~previous workers in Hawai’i have highlight how incorporating tested indigenous~~
 42 stewardship how in geoEarth science courses classes can increase engagement with students by incorporating local by
 43 emphasizing the local, land human interactions to which a learner has an ancestral connection, Hawaiian, and indigenous
 44 stewardship, elder knowledge, Hawaiian place name meanings, and Hawaiian language newspaper records into their
 45 curriculum (e.g., Chinn et al., 2014; Gibson and Puniwai, 2006). Efforts in the Acoma Pueblo community of New Mexico,
 46 USA, have similarly integrated place-based concepts into education to edIndigenous teach about local stratigraphy,
 47 hydrology, and natural resources (e.g., Reano and Hasara, 2024; Reano and Ridgway, 2015). FurthermoreIn fact, Palmer et
 48 al. (2009) focused on Indigenous art from the Southern Great Plains of North America to teach undergraduate natural and
 49 environmental science modules across mineralogy, groundwater hydrology, and local climate hazards. These eEducators
 50 have demonstrated how rigorous programs that incorporate multiple ways of knowing canve increased the interest,
 51 participation, and retention of students from marginalized communities (Alexiades et al., 2021). (Intemann, 2009)These
 52 narratives complement efforts to more effectively teach peer reviewed environmental science to all levels of learners (Lanza
 53 and Negrete, 2007). ThusTherefore, expanding examiningplace-based, artistic, and indigenousIndigenous knowledge in
 54 geoscience engagement has provedis likely key to addressing the needs of more Indigenous Peoplesin valuable for the Earth
 55 sciences as well as for place-based environmental education and engagement in the contemporary world.
 56 A promising candidate for science engagement with place-based Indigenous knowledge recorded in art involves the
 57 Ryukyuan Peoples from the Ryukyu Islands, comprising 21st-century Okinawa Prefecture, Japan. Previous works have
 58 connected Ryukyuan Indigenous knowledge with broad geoscience topics such as groundwater resources (Takahashi, 2022),
 59 regional fisheries (Toguchi et al., 2016), and coral reef geobiology (Toguchi and Nishime, 2013). However, to the best of our
 60 knowledge, no works in English or Japanese have examined the connections between geoscience and one of the most
 61 influential indigenousIndigenous art forms across Okinawa and the Okinawan diaspora, Ryukyuan classical music, also
 62 known as Ryūkyū koten ongaku (琉球古典音楽; hereafter RKO). We compare this tradition with contemporary science
 63 across the atmo-, hydro-, and geosphere to address the question: Does RKO record place-based environmental phenomena

64 useful for geoscience engagement? Here, we focus on a popular RKO repertoire, Nubui Kuduchi (上り口説) and Kudai
65 Kuduchi (下り口説), to trace the 18th-century experiences of Ryukyuan seafaring envoys between Okinawa and Kyushu
66 islands (Okinawa Prefectural Cultural Promotion Association, 2001; Toby, 1984). A review of contemporary geoscience
67 literature finds parallels between these songs and science in Ryukyuan surface winds, oceanic circulation, typhoon activity,
68 and volcanism. Such similarities highlight how Nubui Kuduchi and Kudai Kuduchi may record benchmarks of historical
69 environmental conditions and ,—how Ryukyuan Indigenous knowledge can connect a prominent art form with complex
70 environmental research. Educators and cultural practitioners may use these insights in place-based geoscience engagement,
71 where demand for this work is likely high due to an active Ryukyuan arts scene across the world. Accordingly, we showcase
72 how ,—popular Indigenous music can document scientific observations of climate and geology to engage Indigenous Peoples
73 with their contemporary environmental heritage.

75 **1.1 Ryukyu Kingdom, Okinawa Prefecture, and the Okinawan diaspora**

76

77 **Figure 1: The Ryukyu Islands and southern Kyushu.** Map shows the Kuroshio Current (Gallagher et al., 2015), Ryukyu Trench
 78 (Kamata and Kodama, 1994), approximate route of Ryukyuan envoys (Okinawa Prefectural Cultural Promotion Association,
 79 2001), and subaerial Quaternary volcanoes (Global Volcanism Program, 2024). (inset) Detailed map of Okinawa Island.
 80 Geography from U.S. Department of State, Office of the Geographer (2013).

81 The Ryukyu Islands span a north-south transect between Kyushu and Taiwan in the western Pacific Ocean,
 82 encompassing the Osumi, Tokara, Amami, Okinawa, Miyako, and Yaeyama islands at its maximum geographical extent (Fig.
 83 1). This island arc is the ancestral home of the Indigenous Ryukyuan People and the former Ryukyu Kingdom, established in

84 the 15th century and centered on Okinawa Island (Sakiyama and Oshiro, 1995; Toby, 1984). The kingdom colonized south to
85 the Yaeyama Islands and north to the Tokara Islands during the height of this—of this dynastic period (Akamine, 2017).
86 Contact from foreign trade then influenced—on Ryukyuan culture, from including from China, Japan, Korea, Thailand,
87 Malaysia, and Indonesia (Sakiyama and Oshiro, 1995). However, in 1609 CE, the Ryukyu Kingdom was invaded and
88 subsequently controlled by Japanese forces in the Satsuma Domain of southern Kyushu and the Tokugawa Shogunate in Edo
89 (pre-1868 CE name for Tokyo; Akamine, 2017; Toby, 1984). Consequently, most Ryukyuan territory north of Okinawa
90 Island was ceded to the Satsuma Domain (Akamine, 2017). Historical records suggest ~20 Ryukyuan envoys traveled
91 between Okinawa, Satsuma, and Edo to pay tribute to the Shogunate from 1610 CE until 1872 CE (Okinawa Prefectural
92 Cultural Promotion Association, 2001; Toby, 1984), followed by the annexation of the Ryukyu Kingdom by Japan as
93 Okinawa Prefecture in 1879 CE (Akamine, 2017). During this colonial period, the Japanese government employed
94 assimilationist education policies with the goal of eliminating Ryukyuan languages and cultures (Hammine, 2019;
95 Kaneshiro, 2002). —and“(e.g., Hammine, 2019; Kaneshiro, 2002; Kodama, 1981; Ueunten, 1989)This policy lasted until
96 1945 with the end of World War II and the start of occupation by the USA (Hammine, 2019). Since the reversion of
97 Okinawa Prefecture from the USA back to Japan in 1972, Ryukyuan culture experienced a resurgence across grassroots
98 movements (e.g., Inoue, 2004), language revitalization efforts (e.g., Heinrich, 2018; Zlazli, 2021), and statements from the
99 Okinawan prefectural government (e.g., Abe, 2023). ~~(Anon, 2015)~~

100 Despite this marginalization, the Ryukyu sphere of influence expanded out of East Asia during 19th–20th-century
101 emigration from Okinawa Prefecture, namely to Hawai‘i, Brazil, and Peru that(e.g., Kaneshiro, 2002; Roberson, 2010;
102 Ueunten, 1989) received roughly 20,000, 15,000, and 11,000 immigrants by 1938, respectively (Sellek, 2003). Estimates
103 place cumulative Okinawan immigration between 150,000–200,000 people before the end of World War II; immigrants
104 (Roberson, 2010; Sellek, 2003)to the Japanese mainland were mostly comprised of factory workers, whereas those abroad
105 worked on plantations (Roberson, 2010; Sellek, 2003). In Japan, Okinawans faced a similar system of discrimination as in
106 Okinawa, compounded by social isolation, low wages, and dangerous working conditions (Roberson, 2010). Migrants
107 overseas faced discrimination from two sources: poor plantation conditions by the elite-class plantation owners and a
108 previously established, Japanese immigrant community that held similar prejudices as in Japan (Kaneshiro, 2002; Kodama,
109 1981; Ueunten, 1989). In Hawai‘i, such racial tensions continued until roughly the end of World War II, when second-
110 generation Okinawan and Japanese Americans became dominant over the first-generation immigrants; shared experiences in
111 plantation labor unions, American military service, and communal education likely led to the gradual relinquishment of
112 former prejudices (Ueunten, 1989). Nonetheless, the initial separation of Okinawan and Japanese led to a distinct, Okinawan,
113 and diasporic identity. This identity is evident in the establishment and success of the Hawai‘i United Okinawa Association
114 (HUOA), an amalgamation of ~50 affinity groups that support Okinawan culture and diasporic community in Hawai‘i
115 (Kaneshiro, 2002; Kodama, 1981; Ueunten, 1989). (e.g., Kaneshiro, 2002)(e.g., Sutton, 1983; Teruya, 2014)(Mori,
116 2003)(e.g., Olsen, 1982)(Alonso Ishihara, 2022)(Okamura, 2022)(e.g., Olsen, 1980)An example of HUOA’s success is the
117 annual Okinawan Festival, one of the largest cultural events in Hawai‘i that attracts ~50,000 attendees in the 21st century

118 (Taira, 2023). Brazilian- (Mori, 2003) and Argentine-Okinawans (Alonso Ishihara, 2022), as well as Okinawan communities
 119 across the USA (Okamura, 2022), founded similar associations. Moreover, HUOA and these other associations participate in
 120 the Worldwide Uchinanchu Festival hosted by Okinawa Prefecture (Uchinanchu means “Okinawan People” in one
 121 Ryukyuan language); overseas associations sent ~8,000 attendees in 2016 (Okamura, 2022). Such efforts are fueled by a
 122 “Born Again Uchinanchu” movement that encapsulates third and later generations of the Okinawan diaspora looking to
 123 reconnect with their culture and heritage (Chinen, 2025). Accordingly, Okinawan identity remains visible and active in
 124 diasporasworldwide.

129 1.2 Ryūkyū koten ongaku (RKO) and geologieIndigenous knowledge

130 RKO is one of many visible cultural identifiers for Okinawans in Okinawa Prefecture and in the diaspora (Gillan,
 131 2016; Kaneshiro, 2002; Teruya, 2014; Ueunten, 1989, 2020). The Ryukyu Islands, situated in the western Pacific Ocean
 132 (Fig. 1), are the ancestral home of the indigenous Ryukyuan People and the former Ryukyu Kingdom (Sakiyama and Oshiro,
 133 1995; Toby, 1984). This community has experienced Earth processes that span geology (e.g., Kamata and Kodama, 1994),
 134 oceanography (e.g., Gallagher et al., 2015), and climatology (e.g., Ikema et al., 2010). Records of such phenomena may be
 135 preserved in an intricate performing arts tradition that developed from the kingdom's establishment in the 15th century
 136 (Sakiyama and Oshiro, 1995). According to Sakiyama and Oshiro (1995), Ryukyuan classical music, or Ryūkyū koten (琉球
 137 古典), was developed for entertaining foreign nobility and ambassadors during visits to the Ryukyu Kingdom, which unified
 138 individual fiefdoms on Okinawa Island in 1429 CE. The kingdom expanded from Okinawa Island to surrounding island
 139 groups in the following 100 years. Cross cultural exchange from foreign trade led to the influences of China, Japan, Korea,
 140 Thailand, Malaysia, and Indonesia on Ryūkyū koten. However, in 1609 CE, the Ryukyu Kingdom was invaded and

subsequently controlled by governing forces in the Satsuma Domain of south Kyushu and the Tokugawa Shogunate headed in Edo (pre 1868 CE name for Tokyo; Akamine, 2017; Toby, 1984). Consequently, records suggest 20 Ryukyuan envoys traveled between Okinawa Island, Satsuma, and Edo to pay tribute to the Shogunate from 1610 CE until 1872 CE (Okinawa Prefectural Cultural Promotion Association, 2001; Toby, 1984), followed by the dissolution and annexation of the Ryukyu Kingdom by Japan as Okinawa Prefecture in 1879 CE (Akamine, 2017). In the 21st-century, Ryukyuan classical arts survive through practitioners in the lands that have become Okinawa Prefecture, Japan (e.g., Hanashiro, 2007), and in the Okinawan diaspora worldwide (e.g., Olsen, 1980, 1982; Sutton, 1983). (Kaneshiro, 2002; Miyashiro, 2018; Teruya, 2014; Ueunten, 1989)(e.g., Takahashi, 2022; Toguchi and Nishime, 2013)As such, scientific research on indigenous Ryukyuan culture may illuminate historical environmental processes and create new opportunities for place-based science engagement across the western Pacific. Utilizing According to Sakiyama and Oshiro (1995), RKO is an aristocratic genre that developed during the Ryukyu Kingdom's dynastic period for entertaining visiting emissaries, historically accompanied by male dancers from the noble class (Fig. 2a–b)(Sakiyama and Oshiro, 1995). RKO lyrics are originally from Ryukyuan poetry, which often focuses on metaphors of the natural world to convey human emotions and experiences. These performances are led by *uta sanshin* (唄三線), or a three-stringed lute with vocals (Fig. 2c). The *sanshin* lute itself was brought to Okinawa from China and became a symbol of Okinawan identity (Gillan, 2016). Nonetheless, the *uta* vocal component holds the melody of most RKO songs and is often said to be more central to RKO than *sanshin* (Ueunten, 2020). Other instruments that accompany *uta sanshin* include *fwansō* (笛; bamboo flute; Fig. 2d), *kūchō* (胡弓; fiddle; Fig. 2e), *kutū* (箏; zither; Fig. 2f), and *tēku* (太鼓; drums; Fig. 2g). Such RKO gained distinct Japanese influences after the Satsuma invasion and increased contact with the Satsuma Domain through Ryukyuan envoys (Okinawa Prefectural Cultural Promotion Association, 2001; Toby, 1984). RKO developed into commercial and popular theater when the demand for Ryukyuan court music collapsed after Japanese annexation (Gillan, 2016), which ended historical class and gender restrictions in these aristocratic arts. As such, 21st-century RKO performing arts schools have wide participation in Okinawa Prefecture and the Okinawan diaspora; these schools remain the main mode of RKO transmission –to new learners (e.g., Gillan, 2016; Hanashiro, 2007; Kaneshiro, 2002; Ueunten, 1989). RKO is also visible to non-artists as stone monuments to transformative songs, called *kahi* (歌碑). These monuments are often installed where songs have some lyrical or historical connection to a place, functioning as community centers, artistic venues, and memorials to collective Okinawan experiences (e.g., World War II) or as landmarks in popular paying *kahi* tours (Gillan, 2017). Furthermore, RKO also gained national and prefectural support through designations of National Living Treasures by the Japanese government and the establishment of institutions such as the Okinawa Prefectural University of Arts and the National Theatre Okinawa (Gillan, 2016). Thus, RKO remains a vibrant marker of Ryukyuan culture across the Okinawan community.

Indigenous knowledge of climate and geology may be preserved in RKO, similar to that preserved in traditional ecological practices across the Ryukyu Islands (i.e., Takahashi, 2022; Toguchi et al., 2016; Toguchi and Nishime, 2013). Such artistic knowledge may be adapted into place-based science engagement that addresses issues specific to 1) 4)

174 Okinawans in Okinawa Prefecture and 2) diasporas across the world. Ryūkyū koten in science has the potential to address
175 environmental and societal issues in 21st century Okinawa Prefecture. First, subtropical Okinawa Prefecture. The Ryukyu
176 Islands will likely face challenges due to 21st-century anthropogenic climate change, including coastal flooding, typhoon
177 intensification, and coral bleaching (IPCC, 2023). Likewise, Okinawa Prefecture faces a stagnant college matriculation
178 rate and low standardized test scores relative to the whole of Japan (Kakazu, 2012), which follows historical marginalization
179 (e.g., Abe, 2023; Hammine, 2019; Inoue, 2004) (Kakazu, 2012). These statistics must be contextualized within the history of
180 discriminatory and assimilationist education policies implemented by the Japanese government after annexation with the
181 goal of eliminating Ryukyuan languages and cultures (Hammine, 2019). Research in science education finds that such
182 marginalization can preclude the next generation of marginalized people from entering environmental science studies and
183 careers (Martin and Fisher-Ari, 2021; Padgett, 2001). Due to RKO's visibility in Okinawan culture, More positive
184 representations of indigenous knowledge this art form are likely may be key to geoscience engagement and on and retention
185 efforts in Okinawa Prefecture (Semken et al., 2017). Consequently, increased visibility of Ryūkyū koten may stimulate novel
186 research on the prefecture's climate future, expose students to the utilities of indigenous knowledge, and refocus ancestral
187 arts and culture towards the issues that impact 21st century Okinawans (e.g., Alexiades et al., 2021; Chinn et al., 2014;
188 Gibson and Puniwai, 2006; Reano and Ridgway, 2015). Second, RKO and other folk music genres serve as pillars of
189 Okinawan identity for the Okinawan diaspora, separated from Okinawa by three or more generations in the 21st century and
190 interested in ways to express their identity (Kaneshiro, 2002; Ueunten, 1989). These later generations may not understand
191 Ryukyuan languages and RKO lyrics (Ueunten, 1989), which poses a barrier to accessing Ryukyuan Indigenous knowledge
192 (Chinen, 2025). However, most RKO instructors in the diaspora have trained in or are from Okinawa Prefecture, increasing
193 direct access to such knowledge directly from the homeland (Chinen, 2025; Kaneshiro, 2002; Miyashiro, 2018; Teruya,
194 2014; Ueunten, 1989). The activity in Okinawan associations, like HUOA, exemplifies a demand for more access to RKO-
195 and place-based Indigenous knowledge. (Taira, 2023) (Okamura, 2022) As such, our investigation of RKO can fulfill
196 geoscience engagement goals in Okinawa Prefecture and the global diaspora by elevating place-based, Ryukyuan,
197 Indigenous knowledge as a reputable way of knowing.

198 Such place-based goals follow contemporary endeavors to recognize Ryukyuan indigeneity, particularly against the
199 backdrop of marginalization (e.g., Abe, 2023; Hammine, 2019; Nishiyama, 2023). Works in the similarly subtropical
200 Hawaiian Islands provide ample precedent for utilizing marginalized, indigenous, and Native Hawaiian knowledge in
201 teaching about place-based environmental science (e.g., Chinn et al., 2014; Gibson and Puniwai, 2006; Lemus et al., 2014;
202 Seraphin, 2014; Wiener and Matsumoto, 2014). In fact, the Native Hawaiian Renaissance movement of the late 1900s,
203 during which Hawaiian culture experienced a resurgence amid historical marginalization, provided a direct influence on
204 parallel efforts in 21st century Okinawa Prefecture (e.g., Heinrich, 2018; Kina, 2020). Collaborations therein between the
205 Okinawan diaspora in Hawai'i, Okinawans in Okinawa Prefecture, and the Native Hawaiian community facilitate cross-
206 cultural exchange towards these cultural revitalization endeavors (Ohara and Slevin, 2019). Furthermore, the Hawai'i
207 Okinawa diaspora and those across the Americas (e.g., conterminous USA, Brazil, Peru) also work towards propagating

~~Ryūkyū koten and other Ryukyuan arts (e.g., Izumi, 2020; Kaneshiro, 2002; Miyashiro, 2018; Olsen, 1980, 1982; Sutton, 1983; Teruya, 2014; Ueunten, 1989). These practitioners are often separated from Okinawa by three or more generations in the 20th–21st centuries and may not understand Ryukyuan languages, and therefore Ryūkyū koten lyrics (e.g., Ueunten, 1989). This population, looking to connect with their distant homeland, may be an additional audience for Ryukyuan science engagement through a place based lens by ancestry rather than locality (Semken et al., 2017). Thus, advancements in Ryūkyū koten and place based pedagogy may help develop the global Ryukyuan indigenous movement.~~

~~We take a step toward connecting 18th-century atmo-, hydro-, and geosphere observations with 20th–21st-century scientific studies by investigating a repertoire of classical songs from the Ryukyu Kingdom. Nubui Kuduchi (上り口説) and Kudai Kuduchi (下り口説) trace historical envoys between Okinawa and Kyushu islands (Fig. 1), during which voyagers experienced diverse climate and geological phenomena. Here, we perform a lyrical analysis to extract observations of such phenomena for comparison with contemporary scientific literature. Surface winds, oceanic circulation, typhoon activity, and volcanism in lyrics parallel their descriptions in research—300 years later. These similarities highlight how traditional songs may be historical benchmarks of past environmental conditions. Such benchmarks are likely useful for place-based science engagement among Okinawan communities, linking ancestral arts with climate and geology that can be experienced in the 21st-century. Therefore, we present a foundation for integrating Ryukyuan indigenous knowledge and contemporary scientific perspectives to enhance our understanding and pedagogy of Earth surface processes.~~

~~2 Background~~

~~2.1 Climate~~

~~2.2 Volcanism~~

~~Philippine Sea Plate subduction under the Eurasian Plate occurs east of the Ryukyu Islands at the Ryukyu Trench (Fig. 1; e.g., Kamata and Kodama, 1994). Quaternary island arc volcanism, characteristic of such ocean-continent subduction, is focused north of Okinawa Island (Global Volcanism Program, 2024). In particular, the northern Ryukyu region includes Kikai Caldera, which produced at least three ignimbrite eruptions, including one in the mid-Holocene with a volcanic explosivity index of seven out of eight (Fig. 2a; Machida and Arai, 2003; Maeno and Taniguchi, 2007; Ono et al., 1982). Satsuma Iwojima (“iwo” referring to iō, 硫黄, or sulfur in Japanese) is an island on the perimeter of this submarine caldera and is composed of two volcanoes with different lava types: the basaltic Inamuradake cone and the rhyolitic Iwodake dome (Fig. 2b). The oldest recorded observation of Iwodake activity is from Japanese written tradition, the Heike Monogatari (平家物語), which details late 12th-century volcanism, sulfur mining (Kamada, 1964; Kazahaya et al., 2002; Shinohara et al., 2002), and political banishments to the island (Antoni, 1991). However, subsequent records of volcanic activity from this period are sparse despite a likely Iwodake eruption between 1300–1450 CE, determined from calibrated ¹⁴C ages in~~

decimeter thick rhyolitic flows (Kawanabe and Saito, 2002). Residents also reported active fumaroles (volcanic gas vents) and small eruptions but with no recorded timings or further details (Kamada, 1964; Shinohara et al., 2002). Nonetheless, Iwodake gas discharge events were recorded in the 20th and 21st centuries, producing transient, fine, ash fall deposits that were observable only on smooth surfaces up to ten kilometers away (Kazahaya et al., 2002; Shinohara et al., 2002). Research has attributed this activity to Kikai Caldera magma and degassing, highlighting an interconnected magma conduit at depth (Saito et al., 2001) and activity for over 1000 years (Kawanabe and Saito, 2002; Shinohara et al., 2002).

Extensive caldera complexes are also located in southern Kyushu (Nagaoka, 1988). The Ata and Aira Calderas host the Quaternary active stratovolcanoes Kaimondake and Sakurajima, respectively (Fig. 2a). Kaimondake is a relatively uneroded cone at the entrance to Kagoshima Bay that last erupted in 885 CE (Fig. 2c; Fujino and Kobayashi, 1997). Roughly 50 km north, Sakurajima is a volcano in Kagoshima Bay and hosts three peaks: Kitadake, Nakadake, and Minamidake (translated as north, central, and south peaks; Fig. 2d–e). In particular, Minamidake and surrounding fissures and craters had four recorded major eruptions between the 8th–20th centuries, impacting communities including the city of Kagoshima less than ten kilometers away (Fig. 2a; Kobayashi and Tameike, 2002). Sakurajima remains active in the 21st century, with nearly 3000 Vulcanian-style eruptions between 2008–2011 CE (e.g., Iguchi et al., 2013).

2.3 Ryukyu Kingdom and culture

According to Sakiyama and Oshiro (1995), Ryukyuan classical music, or *Ryūkyū koten* (琉球古典), was developed for entertaining foreign nobility and ambassadors during visits to the Ryukyu Kingdom, which unified individual fiefdoms on Okinawa Island in 1429 CE. The kingdom expanded from Okinawa Island to surrounding island groups in the following 100 years. Cross-cultural exchange from foreign trade led to the influences of China, Japan, Korea, Thailand, Malaysia, and Indonesia on *Ryūkyū koten*. However, in 1609 CE, the Ryukyu Kingdom was invaded and subsequently controlled by governing forces in the Satsuma Domain of south Kyushu and the Tokugawa Shogunate headed in Edo (pre-1868 CE name for Tokyo; Akamine, 2017; Toby, 1984). Consequently, records suggest 20 Ryukyuan envoys traveled between Okinawa Island, Satsuma, and Edo to pay tribute to the Shogunate from 1610 CE until 1872 CE (Okinawa Prefectural Cultural Promotion Association, 2001; Toby, 1984), followed by the dissolution and annexation of the Ryukyu Kingdom by Japan as Okinawa Prefecture in 1879 CE (Akamine, 2017).

2.4 Nubui Kuduchi and Kudai Kuduchi

Nubui Kuduchi and Kudai Kuduchi are a pair of *Ryūkyū koten* songs composed during the Satsuma Domain's rule over the Ryukyu Kingdom. These songs are usually attributed to the *Ryūkyū koten* master Yakabi Chōki (屋嘉比朝寄; 1716–1775 CE; surname first following Japanese naming convention; Gillan, 2012; Kinjo, 1992). *Kuduchi* (口説) refers to a subgenre of *Ryūkyū koten* with a distinctly Japanese, rather than Ryukyuan, seven-five beat structure (Kinjo, 1992). *Kuduchi* lyrics often tell a chronological story or describe a scene (Seki, 2024), where *nubui* (上り) refers to “climbing up” to Satsuma and *kudai*

(下り) to “climbing down” to Okinawa Island (Kinjo, 1992; Seki, 2024). As such, these songs detail an envoy’s 18th-century journey between the Ryukyu Kingdom and Satsuma Domain (Fig. 1).

According to Kinjo (1992) and Sakiyama and Oshiro (1995), Nubui Kuduchi and Kudai Kuduchi performances were historically reserved for entertaining Satsuma Domain officials in the Ryukyu Kingdom. Dancers perform with a folding fan in each hand or a traveler’s cane for Nubui Kuduchi or Kudai Kuduchi, respectively (Fig. 3a–b). This repertoire may be accompanied by *uta sanshin* (唄三線; vocals and a three-stringed lute; Fig. 3c), which leads *fransō* (笛; bamboo flute; Fig. 3d), *kūchō* (胡弓; fiddle; Fig. 3e), *kutū* (箏; zither; Fig. 3f), and *tēku* (太鼓; drums; Fig. 3g). The song and dance represent different aspects of the journey and have a relatively masculine connotation related to its brisk tempo, karate influence, and the harrowing journey itself. In the 21st-century, schools working to preserve the Ryukyuan arts often perform Nubui Kuduchi, Kudai Kuduchi, and other *Ryūkyū koten* songs at cultural events across Okinawa Prefecture (e.g., Hanashiro, 2007) and for the Okinawan diaspora worldwide (e.g., Miyashiro, 2018; Olsen, 1980, 1982; Sutton, 1983; Teruya, 2014; Ueunten, 1989).

2.3 Methods

2.1 Song background and lyrical interpretation

We focus on Nubui Kuduchi and Kudai Kuduchi, which are a pair of *Ryūkyū koten* songs were composed during the Satsuma Domain’s rule over the Ryukyu Kingdom. These songs are usually attributed to the *Ryūkyū koten* RKO master Yakabi Chōki (屋嘉比朝寄; 1716–1775 CE; surname first following Japanese naming convention; Gillan, 2012; Kinjo, 1992). *Kuduchi* (口説) refers to a subgenre of *RKO Ryūkyū koten* with a distinctly Japanese, rather than Ryukyuan, seven-five beat structure (Kinjo, 1992) and often, *Kuduchi* lyrics often tell a chronological story or describe a scene (Seki, 2024). Then, where *nubui* (上り) refers to “climbing up” to Satsuma and *kudai* (下り) to “climbing down” to Okinawa Island (Kinjo, 1992; Seki, 2024). Thus, As such, these songs detail a Ryukyuan envoy’s 18th-century journey between the Ryukyu Kingdom and Satsuma Domain during the Japanese colonial period (Fig. 1).

According to Kinjo (1992) and Sakiyama and Oshiro (1995), Such Nubui Kuduchi and Kudai Kuduchi performances were historically reserved for entertaining Satsuma Domain officials in the Ryukyu Kingdom, where Dancers performers with dance with a folding fan in each hand or a traveler’s cane for Nubui Kuduchi or Kudai Kuduchi, respectively (Fig. 2a–b) (Fig. 2a–b; Sakiyama and Oshiro, 1995). This repertoire may be accompanied by *uta sanshin* (唄三線; vocals and a three-stringed lute; Fig. 3c), which leads *fransō* (笛; bamboo flute; Fig. 3d), *kūchō* (胡弓; fiddle; Fig. 3e), *kutū* (箏; zither; Fig. 3f), and *tēku* (太鼓; drums; Fig. 3g). The song and dance represents different aspects of the journey, envoy and have has a relatively masculine connotation related to its brisk tempo, karate influence, and the harrowing journey itself (Kinjo, 1992). Both songs remain popular in 21st-century RKO performances for entertainment and cultural preservation (Hanashiro, 2007). In the 21st-century, schools working to preserve the Ryukyuan arts often perform Nubui Kuduchi, Kudai Kuduchi, and

~~other Ryūkyū koten songs at cultural events across Okinawa Prefecture (e.g., Hanashiro, 2007) and for the Okinawan diaspora worldwide (e.g., Miyashiro, 2018; Olsen, 1980, 1982; Sutton, 1983; Teruya, 2014; Ueunten, 1989).~~

~~First~~Here, we create English synopses of Nubui Kuduchi and Kudai Kuduchi to scientifically interpret both songs. We utilize a version of ~~both these~~ songs from the Afuso Ryū (安富祖流) school of RKO (one of two major schools; Garfias, 1993; Gillan, 2012)~~Ryūkyū koten~~, alongside interpretations from Kinjo (1992), Sakiyama and Oshiro (1995), and Seki (2024). Following best practices in Younging (2018), the authors here include RKO Ryūkyū koten Master Instructors June Y. Uyeunten and Kenton A. Odo (hereafter J.Y. Uyeunten and K.A. Odo, respectively) ~~with of~~ the Ryukyu Koten Afuso Ryu Ongaku Kenkyu Choichi Kai USA (hereafter Choichi Kai USA), serving the Okinawan diaspora in Hawai‘i, USA. Both authors provide access to oral and written information on Nubui Kuduchi and Kudai Kuduchi, including personal communications and interpretations from Clarence T. Nakasone (hereafter C.T. Nakasone; 1998) of the Hooe Ryu Hana Nuuzi no Kai Nakasone Dance Academy, also based in Hawai‘i. In addition, the first author is an *uta sanshin* practitioner with ~~the~~ Choichi Kai USA at the time of publication. We provide supplementary videos with song lyrics, translations, and interpretations from the above sources, with permission and production from J.Y. Uyeunten, K.A. Odo, and the aforementioned dance academy (Higa et al., 2024a, b). We caution that these supplements are solely to provide references for lyrical synopses; we do not claim intellectual property for the songs and lyrics themselves and do not assert that these songs should enter the public domain or become gnaritas nullius (“no one’s knowledge” in Latin; i.e., Younging, 2018). These precautions are to ensure that ~~indigenous~~Indigenous knowledge is properly ~~attributed~~credited and utilized. In addition, we acknowledge that the other major RKO school, Nomura Ryū (野村流), may hold different versions of Nubui Kuduchi and Kudai Kuduchi. However, as all authors are members of an Afuso Ryū branch, we opt to use our school’s version as a base, which is supplemented by insights from other textual and academic sources (i.e., Kinjo, 1992; Sakiyama and Oshiro, 1995; Seki, 2024). We note that in Afuso Ryū and Nomura Ryū diverged from two students of the same Master Instructor in the 19th century and that most differences between the schools occur in singing or playing style; Afuso Ryū techniques are said to be closer to the original lineage, whereas those of Nomura Ryū were simplified and standardized to make the art more accessible (Garfias, 1993; Gillan, 2012). As the lyrics are mostly consistent across schools (except where we indicate notable variations), differences in interpretation due to version control are likely minimal.~~variations.~~

2.2 Climate and volcanology literature review

We link observations of climate, geology, and the environment within Nubui Kuduchi and Kudai Kuduchi synopses to 20th- and 21st-century scientific studies by noting similarities and differences therein, similar to Swanson (2008). Swanson (2008) utilizes a Hawaiian oral history of the volcano deity Pele and her sister Hi‘iaka in combination with 1812 CE written records from European Christian missionaries to improve scientific interpretations of caldera formation at Kīlauea Volcano, Hawai‘i. The version of the oral history examined in Swanson (2008) is believed to be the most unaffected by Western

333 influences, but other versions are likely to be fundamentally similar, much like just as Nubui Kuduchi and Kudai Kuduchi are
334 likely similar are similar across RKO schools. Swanson (2008) presents a literature review on Kīlauea geochronology and
335 stratigraphy to compare with the oral and written histories. It was found that radiometric dating, Hawaiian oral tradition,
336 and written records agree that the extant Kīlauea Caldera likely formed between 1470–1500 CE; the caldera was previously
337 thought to have formed in 1790 CE during an explosive eruption. A Consequently major discussion point of Swanson (2008)
338 is that such a conclusion may have been accepted by the scientific community earlier if Indigenous knowledge had been
339 seriously considered.

340 Here, we follow the methods of Swanson (2008) because we have a parallel aim to examine the correspondence
341 between an Indigenous record and scientific literature. Second, we link observations of climate, geology, and environment
342 within these songs to 20th– and 21st–century studies by noting similarities and differences therein, similar to Swanson (2008).
343 (Ludwin et al., 2005)(Businger et al., 2018)W firstreviewFor our literature review, we cover 20th – 21st–century research
344 across Ryukyuan climate and volcanology, two topics that we identify as likely recorded in Nubui Kuduchi and Kudai
345 Kuduchi. We focus our review on the natural conditions of climate and volcanic systems that Ryukyuan envoys may have
346 experienced during 18th–century travels. We also review potential impacts on 21st–century Okinawans by anthropogenic
347 climate change or volcanic hazards. iswhoNext, we systematically extract lyrical observations from our synopses as either
348 climate- or volcanology-related. We then subgroup these observations into specific phenomena or locations from the
349 corresponding scientific from the scientific literature to Thusseshowcase similarities or differences between sources. Finally,
350 we discuss novel scientific and cultural implications from such climate and volcanic links, which –can be tailored to
351 addressgeoscience engagement in Okinawa Prefecture and abroad. We acknowledge that, unlike Swanson (2008), Nubui
352 Kuduchi and Kudai Kuduchi do not point to a single geologic event, but rather to general climate or geologic conditions.
353 Nonetheless, these generalized links can be used in lessons to relate RKO with environmental researchplace based–. Lastly,
354 we use the discussion to propose that these links are benchmarks for climate and geologic conditions across century
355 timescales. WBy connecting observations through time, we therefore aim to showcasedemonstrate the utility of Ryukyuan
356 indigenousIndigenous knowledge from RKO for to increaseing Earth-geoscience engagement in Okinawan communities;
357 linking an ancestral art form with environmental issues facing Okinawans in the 21st–century.

358 For the previous and following descriptions, we italicize Ryukyuan and Japanese common nouns and utilize
359 diacritical marks for Ryukyuan and Japanese words where kana and kanji scripts are provided. Some kana may not reflect
360 21st–century Japanese pronunciation but represent common transliterations of the Ryukyuan languages. We use anglicized
361 names and roman type for proper nouns or when kana and kanji are not provided.

364
365 Figure 3: Historical sites in Nubui Kuduchi and Kudai Kuduchi on Okinawa Island photographed from 2023–2024. (a) Shuri
366 Kannondo Buddhist temple in Shuri from first verse of Nubui Kuduchi and (b) Sogenji Buddhist temple ruins in Naha from
367 second verse of Nubui Kuduchi, where voyagers prayed for ocean safety. (c) View from Miegusuku Fortress in Naha from both
368 songs, looking west out of Naha port where voyagers departed from and returned to Okinawa Island and (inset) atop fortress
369 ruins. (d) Cape Zampa from both songs, looking west near where voyagers noted wind and ocean conditions. See locations in Fig. 1.

370
371 Based on Kinjo (1992), Sakiyama and Oshiro (1995), and Seki (2024), discussions with J.Y. Uyeunten and K.A.
372 Odo of Choichi Kai USA, and personal communications with C.T. Nakasone, Nubui Kuduchi details the perilous journey
373 from Okinawa Island to Kyushu. K.A. Odo describes how the word *nubui* also references the difficulty and anxiety of
374 leaving home as an upward climb. The first four verses describe the envoy’s foot journey from Shuri, the Ryukyu capital at
375 the time these songs were composed, to the main port on Okinawa Island in Naha (Fig. 1). Along the way, voyagers pray at
376 and pass by various Ryukyuan shrines and Buddhist temples for safe travels, including Shuri Kannondo and Sogenji ~~for safe~~

377 ~~travels~~ (Fig. 3a–b), ~~noting people coming and going~~. ~~In particular,~~ families of the envoy shed tears due to the dangers at sea
378 facing their loved ones. The fifth and sixth verses detail the start of the voyage when sails pick up winds from the south-
379 southwest and the envoy travels out of Naha port, vowing to someday return to the Miegusuku Fortress (Fig. 3c) and Cape
380 Zampa on the west coast of Okinawa Island (Fig. 3d). Here, south-southwest is referred to as the direction of the Horse and
381 Sheep, collectively assigned this cardinal direction from the Chinese Zodiac (Seki, 2024). In the seventh verse, the envoy
382 encounters rough seas near Iheya Island, ~100 km from the port but only ~40 km from the north point of Okinawa Island.
383 Looking out over a “route of many islands” (i.e., Amami Islands; Okinawa Prefectural Cultural Promotion Association,
384 2001), the envoy surveys the upcoming seven islands (i.e., Tokara Islands in the Tokara Strait) that are often rough sailing
385 and expresses hope for a peaceful transit. The last verse describes the final approach to the Satsuma Domain of southern
386 Kyushu (~~Fig. 2~~Fig. 4a), wherein the envoy observes smoke from Iwodake volcano on the island of Satsuma-Iwojima (~~Fig.~~
387 ~~2~~Fig. 4b). Of note, the version of this song from C.T. Nakasone describes the smoke as rising (*tachuru*; 立ちゆる), while the
388 Afuso Ryū version notes the smoke is burning or glowing (*moyuru*; 燃ゆる). Finally, the envoy sails past Cape Sata on
389 Kyushu, where Kaimondake (~~Fig. 2~~Fig. 4c) and Sakurajima (~~Fig. 2~~Fig. 4d) volcanoes come into view. The song ends with
390 Sakurajima being hailed as mistakeable for the iconic Mount Fuji.

391 Based on Sakiyama and Oshiro (1995) and Seki (2024), discussions with J.Y. Uyeunten and K.A. Odo, and
392 personal communications with C.T. Nakasone, verse one of Kudai Kuduchi begins when envoy members are called to return
393 to Okinawa Island from the Satsuma Domain around the ninth to the tenth month of the lunar calendar (approximately
394 September to October). Such travels occur after the envoy transits from Satsuma to Edo and back, which is not recorded in
395 this repertoire. As *kudai* refers to the act of climbing down, K.A. Odo notes the subtext of an easier, downhill, and more
396 hopeful return home. Consequently, joyous celebrations, more prayers for safety, and Satsuma bureaucratic processes are
397 described in the first to fifth verses. In the sixth to eighth verses, the sails pick up north-northeasterly winds after passing
398 Cape Sata, the rough seas of the Tokara Islands, the Amami Islands, and Iheya Island. North-northeast is referred to as the
399 direction of the Rat and Ox zodiacs (Seki, 2024). Here, the envoy is accompanied by friendly vessels when the voyagers
400 return to when Cape Zampa, as promised comes back into view (Fig. 3d). The final verse describes arriving at the same port
401 from which the envoy left home, with crowds of people welcoming the voyagers back home at Miegusuku Fortress (Fig. 3c).

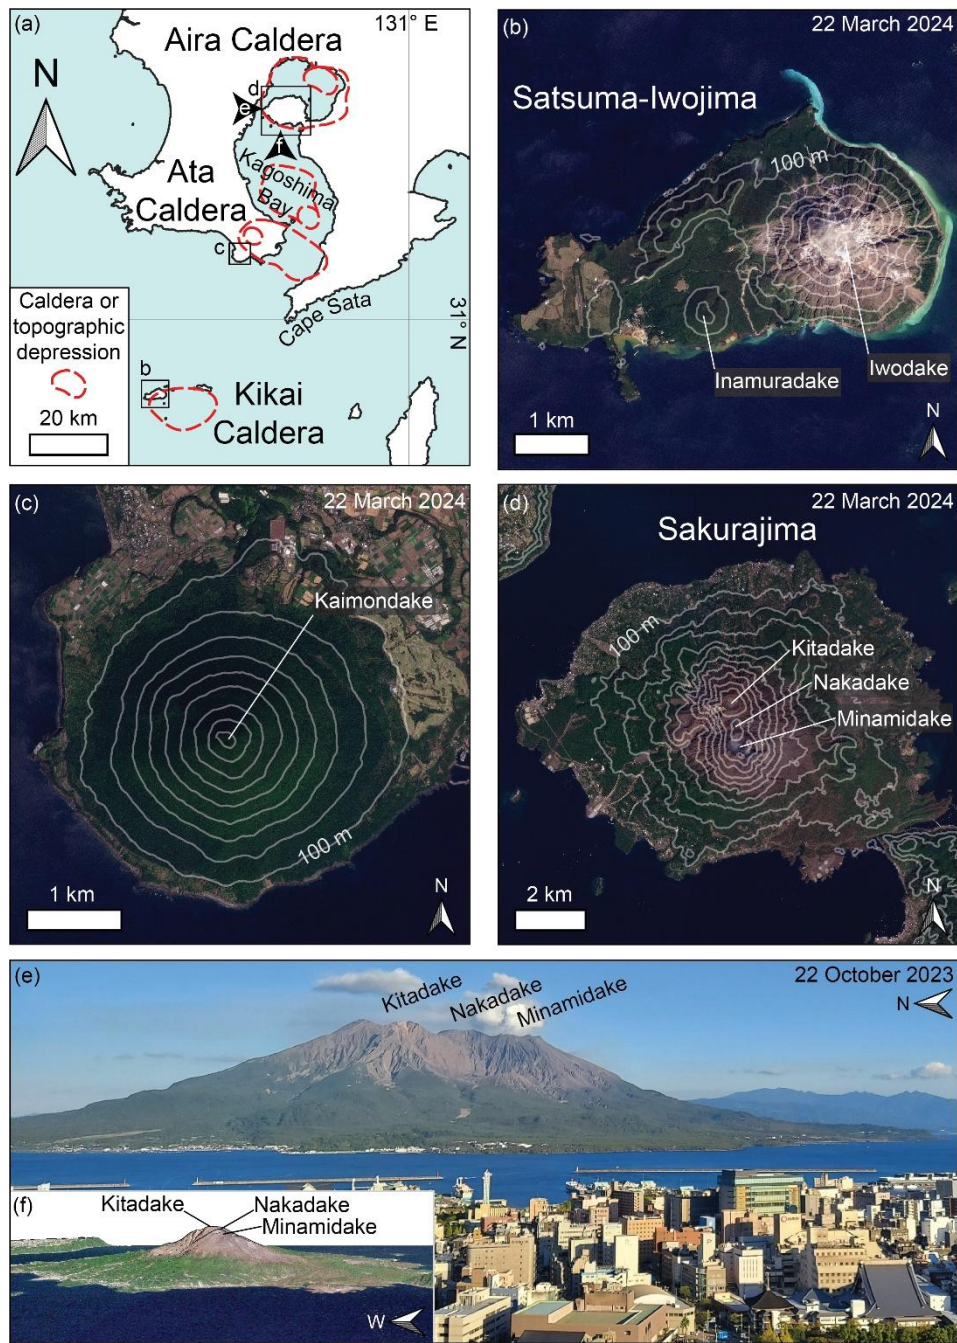

Figure 4: (a) Calderas and topographic depressions of southern Kyushu and the northern Ryukyu island arc (Maeno and Taniguchi, 2007; Nagaoka, 1988) with location of subplots as boxes or arrows indicating view direction. Geography from U.S. Department of State, Office of the Geographer (2013). PlanetScope 3 m resolution images of (b) Satsuma-Iwojima, (c) Kaimondake, and (d) Sakurajima (Image © 2025 Planet Labs; Planet Team, 2025) with 100 m elevation contours from 1 arc-second Shuttle Radar Topography Mission. (e) Sakurajima with Kagoshima City in foreground looking east versus (f) looking north with PlanetScope image draped over elevation.

43.2 CILinks to climate

3.2.1 Ryukyu climate review

~~Here, the Kuroshio Current dominates oceanic circulation, bringing equatorial waters north into the East China Sea; this warm current then reenters the Pacific Ocean through the Tokara Strait and into the northern Pacific gyre (Fig. 1; Gallagher et al., 2015). By bringing warm water in contact with cool air, the Kuroshio Current is also important for atmospheric conditions across the Ryukyu Islands, particularly during the winter and spring (Liu et al., 2013). The East Asian monsoon system drives atmospheric circulation and a seasonal transition of winds in the Ryukyu Islands, from northeasterlies during the Boreal winter to southwesterlies during the Boreal summer (Dobby, 1945; Flohn, 1957; Fu et al., 1983; Ueda et al., 1995). Then, the Kuroshio Current dominates oceanic circulation, bringing equatorial waters north into the East China Sea following the Ryukyu island arc; this warm current reenters the Pacific Ocean through the Tokara Strait and into the northern Pacific gyre (Fig. 1; Gallagher et al., 2015). Measurements of the Kuroshio Current along the Ryukyu Islands and through the Tokara Strait show high wave heights and ocean turbulence due to ocean-atmosphere coupling (Hwang, 2005) and interactions with bathymetric features such as volcanic seamounts along the Tokara Islands (Nagai et al., 2021; Tsutsumi et al., 2017). Previous research works highlight how the Kuroshio Current and East Asian monsoon and Kuroshio Current, thus the climate of the Ryukyu Islands, may be altered by anthropogenic climate change. For example, the Kuroshio Current is vulnerable to shifts in location and strength (e.g., Sakamoto et al., 2005; Wu et al., 2012; Zhang et al., 2020). Likewise, monsoonal winds (Kitoh, 2017) and Hadley cell circulation (Lu et al., 2007) may weaken over the western Pacific. Likewise, the Kuroshio Current is vulnerable to shifts in location and strength (e.g., Sakamoto et al., 2005; Wu et al., 2012; Zhang et al., 2020).~~

Typhoons are also common occurrences across the Ryukyu Islands (e.g., Ikema et al., 2010), constituting a critical feature of local climate and weather. Oceanic moisture (Ikema et al., 2010; Kitoh, 2017) and atmospheric forcing (Sun et al., 2015, 2017) help form then steer these storm systems from the tropical western Pacific toward subtropical East Asia (e.g., Wu and Wang, 2004; Yang et al., 2020). ~~In turn, typhoons impact ocean conditions through increased wind speed and wave heights in the western Pacific region (Wu et al., 2014; Young et al., 2011). Previous research suggests that~~ Moreover, the El Niño-Southern Oscillation (ENSO) can ~~also~~ affect typhoon tracks. El Niño (i.e., periods of warming sea surface temperatures) is correlated with more typhoons recurving north, often toward the Ryukyu Islands; conversely, La Niña (i.e., periods of cooling sea surface temperatures) is characterized by more storms tracking west toward continental Asia (Ito et al., 2020; Sun et al., 2015, 2017; Wang and Chan, 2002; Wu and Wang, 2004; Yang et al., 2020). Variability in the western North Pacific Subtropical High is important for such ~~typhoon~~ tracking, as an eastward retraction of this persistent zone of high pressure allows typhoons to recurve north (Sun et al., 2015, 2017). These typhoons heading to higher latitudes help facilitate poleward energy transport (Wang and Chan, 2002). Therefore, while typhoons are weather phenomena, they both impact and are impacted by ~~(e.g., ENSO)~~ climate ~~(e.g., ENSO). T~~; typhoons are expected to become larger (Sun et al., 2015,

2017), rainier (Ikema et al., 2010; Kitoh, 2017), and more north-recurving (e.g., Yang et al., 2020) due to anthropogenic climate change.

443

444

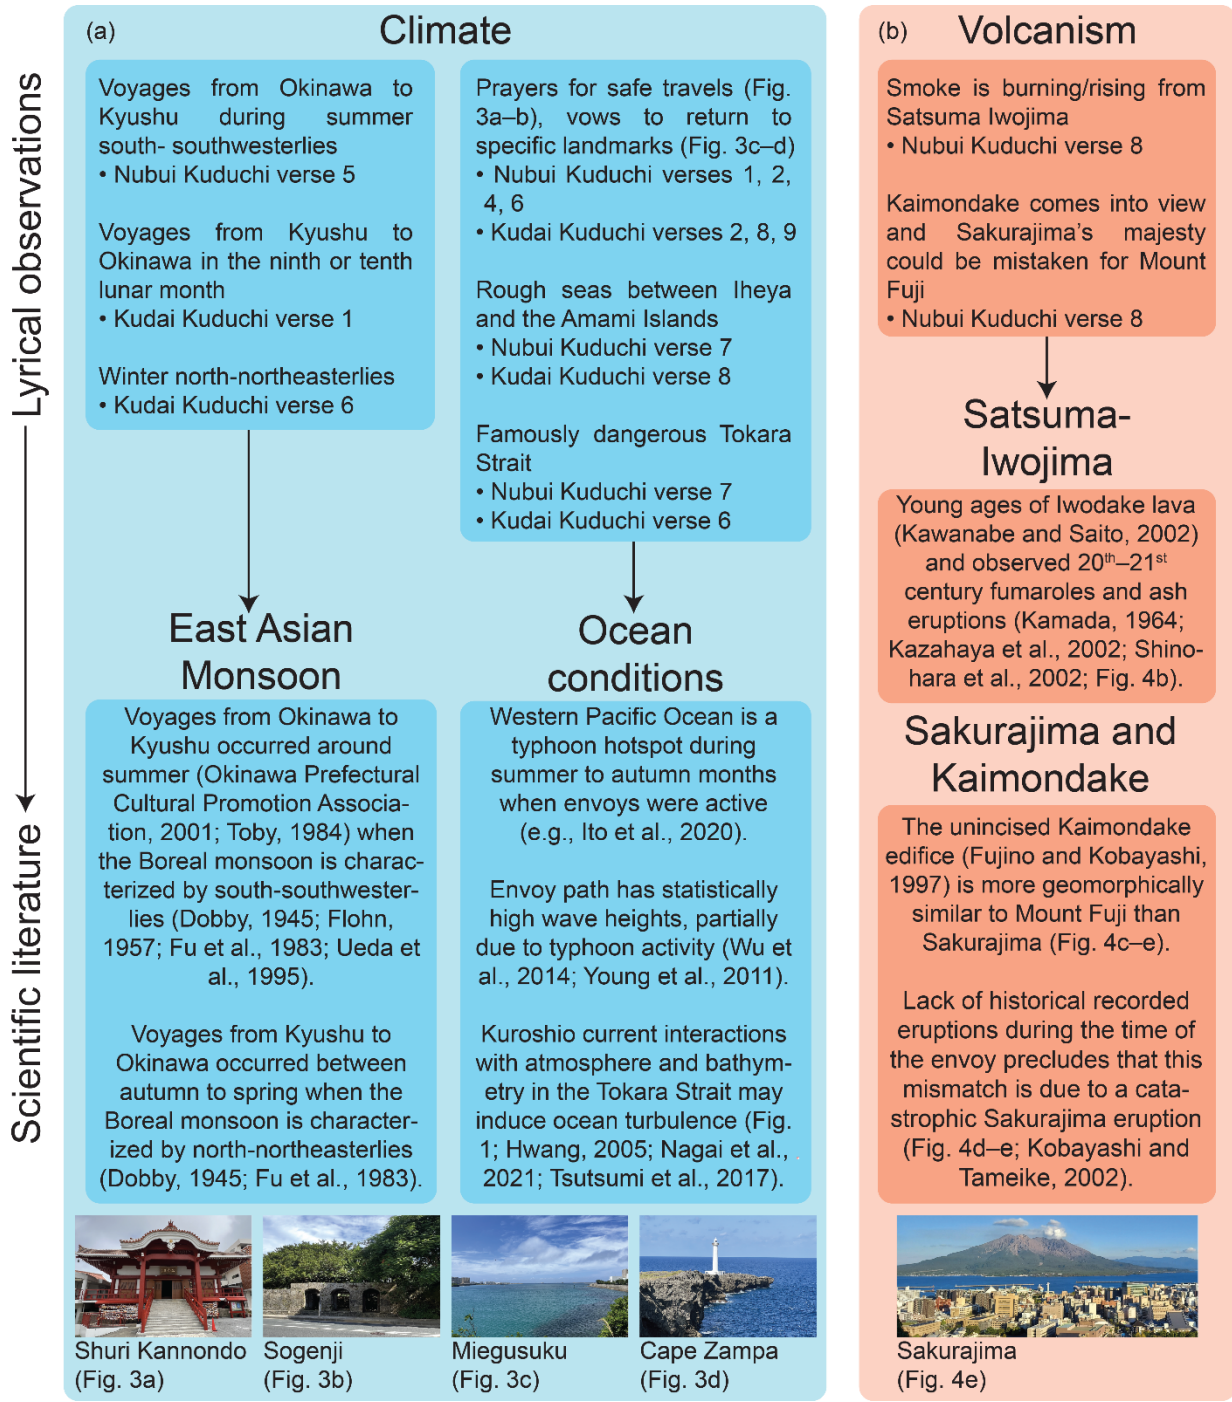

Figure 5: LSummarized-inking lyrical observations with scientific literature on climate and volcanic systems that Ryukyuan envoys may have experienced. First, we extract (a) climate and (b) volcanic observations from 18th-century verses of Nubui Kuduchi (left) and Kudai Kuduchi (right)Nubui Kuduchi and Kudai Kuduchi (top), linked with 20th-21st-century scientific observations and literature of climate and volcanism (center). Climate and volcanism are divided into specific phenomena or locations that are likely sung about in both songs. Then, we subgroup lyrics that correspond with scientific literature on the East Asian Monsoon, ocean conditions, Satsuma-Iwojima, or Sakurajima and Kaimondake, related to Some verses or observations may discuss oceanic conditions currents (Fig. 1), landmarks (Fig. 3), and volcanic landformsvolcanoes (Fig. 4) that are observable or visitable in the 21st century (bottom).

3.2.2 Lyrical links to climate

We link the south-southwesterly winds described in Nubui Kuduchi with 20th-21st-century observations of the south to southwesterly winds that prevail during the Boreal summer monsoon from May to September (Dobby, 1945; Flohn, 1957; Fu et al., 1983; Ueda et al., 1995). As Nubui Kuduchi does not explicitly mention the timing of Satsuma-bound envoys, climatological winds, we utilize historical records and genealogies that show the ~20 departures from Naha port occurred between the fifth and eighth months of the lunar calendar (approximately May to August; Okinawa Prefectural Cultural Promotion Association, 2001; Toby, 1984). agreeing with lyrics and the scientific literature (Fig. 5a). ~~Here, south to southwesterly winds prevail during the Boreal summer monsoon from May to September (Sect. 2.1; Dobby, 1945; Flohn, 1957; Fu et al., 1983; Ueda et al., 1995).~~ After arriving in Satsuma and traveling to and from Edo, Kudai Kuduchi shows describes the envoys returning to Okinawa Island on early autumn north-northeasterly winds. Historical records show that envoys returned to Naha port between the eleventh and fourth month of the lunar calendar (approximately November to April; Okinawa Prefectural Cultural Promotion Association, 2001). ~~These lyrics and records are~~ consistent with the northeasterly Boreal winter monsoon from September to May (Dobby, 1945; Fu et al., 1983). Accordingly, the we can link the specific directions and seasonality of winds in Nubui Kuduchi, and Kudai Kuduchi, and historical records can be leveraged in a place-based framework to link with the East Asian monsoon system in scientific literature with Ryukyuan history and culture.

Both songs also then mention prayers for safe travels, showing implying that the envoy acknowledged the dangerous dangers of the upcoming voyages (Fig. 5). We link this and other lyrical observations of concerns for potentially dangerous ocean conditions between Iheya and the Tokara Islands with three scientific points (Fig. 5a). First, the envoy intersects the apex of the Kuroshio current at the famously dangerous seas of the Tokara Strait (Fig. 1). This region is associated with high wave heights from ocean-atmosphere coupling (Hwang, 2005) and interactions with seamount bathymetry that induce turbulence in the near-surface ocean (Nagai et al., 2021; Tsutsumi et al., 2017). ~~First~~ Second, Holocene geologic evidence, modern climatological data, and numerical models highlight the commonality of typhoons that may cross the envoy's approximate path (Fig. 1; ~~Ito et al., 2020; Sun et al., 2017; Wang and Chan, 2002; Wu and Wang, 2004; Yang et al., 2020~~), particularly during El Niño periods of ENSO (Ito et al., 2020; Sun et al., 2017; Wang and Chan, 2002; Wu and Wang, 2004; Yang et al., 2020). In fact, the timings of some journeys put certain envoys in the timeframe of the highest typhoon activity from July to September (Wu and Wang, 2004). ~~Second~~ Third, the region between Kyushu and Taiwan has relatively high average and maximum wave heights compared to surrounding seas, in part because of due to the

presence of these typhoons (Wu et al., 2014; Young et al., 2011). ~~Third, the Tokara Strait is where the Kuroshio Current crosses the Ryukyu Islands and reenters the Pacific Ocean (Fig. 1). Here, the envoy intersects the apex of the current (Gallagher et al., 2015), which is associated with comparatively high wave heights than farther away (Hwang, 2005). Interactions between the current and high relief bathymetry, such as seamounts, are also thought to induce turbulence in the near surface Tokara Strait (Nagai et al., 2021; Tsutsumi et al., 2017).~~ Therefore, Nubui Kuduchi and Kudai Kuduchi can be ~~utilized to examine~~linked with the impacts of ocean currents, typhoons, ~~and atmosphere-ocean-ocean-atmosphere coupling, and currents on~~ dangerous ocean conditions in the western Pacific Ocean~~Ryukyuan oceanic conditions.~~

4.3.3 Links to volcanism

3.3.1 Ryukyu volcanism review

Philippine Sea Plate subduction under the Eurasian Plate occurs east of the Ryukyu Islands at the Ryukyu Trench (Fig. 1; e.g., Kamata and Kodama, 1994). Quaternary island arc volcanism, characteristic of such ocean-continent subduction, is focused north of Okinawa Island (Global Volcanism Program, 2024). In particular, the northern Ryukyu region includes Kikai Caldera, which produced at least three ignimbrite eruptions including one in the mid-Holocene with a volcanic explosivity index of seven out of eight (Fig. 4a; Machida and Arai, 2003; Maeno and Taniguchi, 2007; Ono et al., 1982). Satsuma-Iwojima (“iwo” referring to iō, 硫黄, or sulfur in Japanese) is an island on the perimeter of this submarine caldera composed of two volcanoes with different lava types: the basaltic Inamuradake cone and the larger, rhyolitic Iwodake dome (Fig. 4b). The oldest recorded observation of Iwodake activity is from Japanese written tradition, the Heike Monogatari (平家物語), which details late-12th-century volcanism, sulfur mining (Kamada, 1964; Kazahaya et al., 2002; Shinohara et al., 2002), and political banishments to the island (Antoni, 1991). However, subsequent records of volcanic activity from this period are sparse despite a likely Iwodake eruption between ~1300–1450 CE, determined from calibrated ¹⁴C radiometric ages in decimeter-thick rhyolite flows (Kawanabe and Saito, 2002). Residents also reported active fumaroles (volcanic gas vents) and small eruptions but with no recorded timings or further details (Kamada, 1964; Shinohara et al., 2002). Nonetheless, Iwodake gas discharge events were recorded in the 20th and 21st centuries, producing transient, fine, ash fall deposits that were observable only on smooth surfaces up to ten kilometers away (Kazahaya et al., 2002; Shinohara et al., 2002). Research has attributed this activity to Kikai Caldera magma and degassing, highlighting an interconnected magma conduit at depth (Saito et al., 2001) and activity for over 1000 years (Kawanabe and Saito, 2002; Shinohara et al., 2002). Despite sparse records from what are effectively three observations of volcanism through time~~In the 21st century, such activity has extensive impacts on water quality by hydrothermal leaching (e.g., Kiyokawa et al., 2012) and air quality by sulfate aerosols (e.g., Itahashi et al., 2019) locally and throughout the western Pacific region.~~

Extensive caldera complexes are also located in southern Kyushu (Nagaoka, 1988). The Ata and Aira Calderas host the Quaternary-active stratovolcanoes Kaimondake and Sakurajima, respectively (Fig. 4a). Kaimondake is a relatively

513 uneroded cone at the entrance to Kagoshima Bay that last erupted in 885 CE (Fig. 4c; Fujino and Kobayashi, 1997). Roughly
514 50 km north, Sakurajima is a volcano in Kagoshima Bay and hosts three peaks: Kitadake, Nakadake, and Minamidake
515 (translated as north, central, and south peaks, respectively; Fig. 4d–e). In particular, Minamidake and surrounding fissures
516 have four recorded major eruptions between the 8th–20th centuries, impacting communities including the city of Kagoshima
517 less than ten kilometers away (Fig. 4a; Kobayashi and Tameike, 2002). Sakurajima remains active in the 21st century, with
518 nearly 3000 Vulcanian-style eruptions between 2008–2011 (e.g., Iguchi et al., 2013).

519 3.3.2 Lyrical links to volcanism

520 Upon arrival in Satsuma, Nubui Kuduchi mentions Kaimondake and Sakurajima but likely only holds geologically
521 interpretable observations of Satsuma-Iwojima (see Sect. 4.1 for Kaimondake and Sakurajima). Here, the ~~envoy song~~
522 describes Satsuma-Iwojima activity as a gas or ash plume ~~from the summit of Iwodake. W.~~ We link these lyrical
523 observations ~~to with the~~ historical (Kamada, 1964) and scientific (Kazahaya et al., 2002; Shinohara et al., 2002) observations
524 of ~~the~~ active Iwodake fumaroles and ash eruptions documented in the 20th–21st centuries (Fig. 5b). In fact, lyrics of burning
525 or glowing smoke are similar to the discharge of hot and illuminated gases from a 1996 nighttime eruption described
526 ~~undescribed in~~ Shinohara et al. (2002). Therefore, 18th-century Nubui Kuduchi adds an intermediary observation of Iwodake
527 activity between the 12th-century Heike Monogatari and 20th–21st-century scientific studies. ~~We~~ ~~Despite sparse records~~
528 ~~from what are effectively three observations of volcanism through time, such activity has extensive impacts on water quality~~
529 ~~by hydrothermal leaching (e.g., Kiyokawa et al., 2012) and air quality by sulfate aerosols (e.g., Itahashi et al., 2019) locally~~
530 ~~and throughout the western Pacific. Combining lyrical observations with volcanology exemplifies~~ how
531 ~~indigenous~~ Indigenous knowledge from Nubui Kuduchi supports relatively consistent volcanic activity from Iwodake as
532 suggested by radiometric dating and observed eruptions (Kawanabe and Saito, 2002; Shinohara et al., 2002) ~~can highlight~~
533 ~~local eruptive histories and regional volcanic impacts across and beyond the Ryukyu Islands.~~

535 5.4 Discussion

536 5.4.1 Lyrical implications for ~~infer~~ historical climate and volcanism

537 ~~The seasonality of historical wind directions in~~ The similarity of seasonal wind directions in Nubui Kuduchi and
538 Kudai Kuduchi ~~are similar to scientific observations up to the 21st century, as seen by comparing the lyrics themselves,~~
539 historical documents (Okinawa Prefectural Cultural Promotion Association, 2001; Toby, 1984), and the modern monsoon
540 (Dobby, 1945; Flohn, 1957; Fu et al., 1983; Ueda et al., 1995). ~~Therefore, this repertoire~~ implies a reliance on predictable
541 monsoonal winds, ~~which facilitated for the ~20 Ryukyuan envoys going to and from Satsuma~~ (Okinawa Prefectural Cultural
542 Promotion Association, 2001; Toby, 1984) ~~that could be explored as historical climate benchmarks. Deviations from this~~
543 norm could be highlighted and explored as monsoonal abnormalities. For example, genealogies suggest that a 1791 CE

544 envoy was required to wait in Satsuma between the fourth to tenth lunar months of 1791 CE due to unfavorable winds earlier
 545 in the year (Okinawa Prefectural Cultural Promotion Association, 2001). These records could signify a failure of the East
 546 Asian Boreal summer monsoon that coincided with El Niños between 1788–1796 CE, known collectively as the Great El
 547 Niño (Cook et al., 2010; Grove, 2006; Quinn et al., 1987). Records show that envoys did not resume until 1796–1797 CE
 548 near the end of this climate anomaly (Okinawa Prefectural Cultural Promotion Association, 2001; Toby, 1984), but more
 549 historical analyses are required to assert that this envoy gap reflects a monsoon failure. Nubui Kuduchi and Kudai Kuduchi
 550 then detail prayers and tears shed for the dangerous journey ahead (e.g., at locations in Fig. 3a–b), foreshadowing deadly -
 551 ~~These actions may foreshadow~~ typhoons, waves, and ocean currents ~~in the 21st century~~. Speculatively, Ryukyuan voyagers
 552 could have been indirectly praying for La Niña conditions associated with a lower probability that typhoons will track
 553 towards the Ryukyu Islands (Ito et al., 2020; Sun et al., 2015, 2017; Wang and Chan, 2002; Wu and Wang, 2004; Yang et
 554 al., 2020). Likewise, the envoy may have indirectly recorded the impacts of typhoons (Wu et al., 2014; Young et al., 2011)
 555 and the Kuroshio Current (Hwang, 2005; Nagai et al., 2021; Tsutsumi et al., 2017) on ocean conditions in and around the
 556 Tokara Strait, which is highlighted as a treacherous location in both songs. As such, Nubui Kuduchi and Kudai Kuduchi
 557 ~~these songs~~ provide a proof-of-concept for extracting historical climate from Ryūkyū koten IyiesRKO, ~~which can be used~~ to
 558 connect the cultural arts ~~to with geoscience and education~~ in the Ryukyu Islandswestern Pacific.

559 Voyages north of Okinawa Island, where active volcanoes are located (Fig. 1), then offer a rare opportunity to
 560 record volcanism in Ryukyuan songs. If Nubui Kuduchi describes average degassing across the attributed composer's
 561 lifetime (1716–1775 CE; Gillan, 2012; Kinjo, 1992) or the envoy's activity (1610–1872 CE; Okinawa Prefectural Cultural
 562 Promotion Association, 2001; Toby, 1984), perhaps this song represents volcanic processes over ~60 or ~250 years,
 563 respectively. Regardless, this volcanic benchmark from 18th-century Nubui Kuduchi bridges an ~800-year gap between the
 564 12th-century Heike Monogatari and 20th–21st-century studies at Satsuma-Iwojima and Kikai Caldera (e.g., Kawanabe and
 565 Saito, 2002; Kazahaya et al., 2002; Saito et al., 2001; Shinohara et al., 2002). Such a gap may be in part because Satsuma-
 566 Iwojima's population was historically ignored and othered by Japanese society (Antoni, 1991). Thus, lyrical observations
 567 from the Ryukyu Kingdom can help scientists understand the continuity of volcanic activity on this island. For example, the
 568 long-term degassing, ~~as suggested by these historical records, this song~~ agrees with evidence of over 1000 years of eruptive
 569 activity from radiometrically dated Iwodake rocks (Kawanabe and Saito, 2002; Shinohara et al., 2002). These observations
 570 fit into a previously proposed model of a long-term, convecting, and stratified Satsuma-Iwojima magma chamber that feeds
 571 basaltic Inamuradake and rhyolitic Iwodake. ~~Where,~~ workers suggest that denser basalt magma may sit lower in the
 572 chamber to 1) supply the less dense rhyolite magma above with volatile gases that 2) cause this rhyolite to ascend in the
 573 Iwodake magma column and 3) induce surface degassing by decompression to 4) cause this magma to descend once
 574 degassed of buoyant volatiles (Kazahaya et al., 2002; Saito et al., 2001; Shinohara et al., 2002). Therefore, Nubui Kuduchi
 575 may connect surface phenomena with supposedly long-lived and deep magmatic processes at Satsuma-Iwojima over ~800
 576 years.

577 Nubui Kuduchi also compares Sakurajima's geomorphology to that of Mount Fuji. However, the uneroded and
578 single-peaked Kaimondake (Fig. 2Fig. 4c) is more similar to the conical Mount Fuji than Sakurajima (Fig. 4d; Fujino and
579 Kobayashi, 1997). Historical records ~~_(Kobayashi and Tameike, 2002)~~ from this well-populated area precludes that this
580 discrepancy signals ~~that~~ an eruption that dramatically altered Sakurajima's shape ~~into~~ its current form (Kobayashi and
581 Tameike, 2002). The lyrics ~~described herein~~ are likely a poetic interpretation of the first sight of this volcano. Alternatively,
582 the north-south alignment of summit peaks ~~(Fig. 2Fig. 4d)~~ and the south-opening Kagoshima Bay suggest that arriving
583 voyagers would see a more conical volcanic profile than if seen from the east or west ~~(Fig. 2Fig. 4e-f)~~. This geomorphology
584 may also lead to the generous interpretation of Sakurajima as mistakable for Mount Fuji.

585 **54.2 Future ~~work for of~~ place-based Ryūkyū koten ongaku**

586 The links we establish between Nubui Kuduchi, and Kudai Kuduchi, and scientific literature can be utilized in
587 place-based engagement ~~aimed at connecting to highlight the impacts of climate and volcanism on 21st-century Okinawan~~
588 ~~students with their local environment, which follows previous efforts in Hawai'i and North America (e.g., Alexiades et al.,~~
589 ~~2021; Chinn et al., 2014; Gibson and Puniwai, 2006; Reano and Ridgway, 2015).~~ For ~~example~~ Okinawans in Okinawa
590 Prefecture, students may examine the East Asian monsoon system, ENSO, and ~~their influences on~~ observable wind patterns
591 in the 21st-century Ryukyu Islands on which 18th-century voyagers likely relied (following Dobby, 1945; Flohn, 1957; Fu et
592 al., 1983; Ueda et al., 1995). Likewise, ~~although not directly cited,~~ the impacts of typhoons and the Kuroshio Current hinted
593 at in both songs provide ancestral connections to ~~the history of~~ natural disaster awarenesss (following Ikema et al., 2010) and
594 oceanic voyaging in Okinawa. Visiting the sites where voyagers acted upon their knowledge of dangerous wind and ocean
595 conditions, which are now famous landmarks (e.g., Fig. 3)Fig. 3, could emphasize -place-based links between Indigenous
596 knowledge and scientific literature (Fig. 5; Semken et al., 2017). ~~Visiting the sites where voyagers acted upon their~~
597 ~~knowledge of dangerous wind and ocean conditions could also highlight meaningful, place based connections between~~
598 ~~ancestors and contemporaries (Semken et al., 2017). Critical thinking modules can then allow students to hypothesize how~~
599 ~~climate change may modify Ryukyuan winds (e.g., Kitoh, 2017; Lu et al., 2007), typhoons (e.g., Ikema et al., 2010; Sun et~~
600 ~~al., 2015, 2017; Yang et al., 2020), and currents (e.g., Sakamoto et al., 2005; Wu et al., 2012; Zhang et al., 2020) into the~~
601 ~~future. Farther outboard, Iwodake provides linking Nubui Kuduchi modern ones presents an opportunityies to teach recent~~
602 Ryukyuan volcanology and the complex tectonic and geologic processes of the Ryukyu Trench and Kikai Caldera ,
603 ~~respectively~~ (following Kamada, 1964; Kazahaya et al., 2002; Shinohara et al., 2002) ~~how scientists observe volcanic plumes~~
604 ~~and measure their impacts on water and air quality (e.g., Itahashi et al., 2019; Kiyokawa et al., 2012).~~ Critical thinking
605 modules can then allow students to hypothesize how climate change may modify Ryukyuan weather and storms (e.g., Kitoh,
606 2017; Lu et al., 2007) or examine how modern scientists quantify volcanic impacts on air and water quality (e.g., Itahashi et
607 al., 2019; Kiyokawa et al., 2012). For the Okinawan diaspora, modules on Ryukyuan climate change or volcanic hazards
608 could be showcased -high- at popular Okinawan events, such as HUOA's Okinawan Festival. Place-based geoscience
609 connections could also be incorporated into field trips when visiting Okinawa Prefecture for the Worldwide Uchinanchu

610 Festival (Okamura, 2022) or kahi tours (Gillan, 2017). Thus, educators can engage 21st-century ~~Okinawan~~ learners in
611 Okinawa Prefecture and across the overseas diaspora with using the links to contemporary science that we have found in
612 place-based science by highlighting a diversity of environmental benchmarks and ancestral connections in this repertoire of
613 Ryūkyū koten Nubui Kuduchi and Kudai Kuduchi.

614 Taken together, Nubui Kuduchi and Kudai Kuduchi tell a story that matches current knowledge and can fill gaps in
615 ~~understanding the climate and geology of the Ryukyu Islands. Similar~~ Similar Earth geoscience insights could be ~~expanded~~
616 ~~examined from~~ by applying this framework to additional additional Ryukyuan performing arts. ~~Here, island communities rely~~
617 ~~on springs for survival, transforming groundwater into a sacred resource (Takahashi, 2022). Likewise, popular songs such~~
618 ~~as~~ Following the works on Indigenous knowledge of freshwater resources in Takahashi (2022), Nuchibana (貫花) and Amakā
619 (天川) are popular songs that also speak of rivers and water around Okinawa (Seki, 2024). ~~Then, Researchers then document~~
620 ~~traditional names of fishing areas that describe reef geobiology (Toguchi and Nishime, 2013)~~ descriptions of the Okinawan
621 nearshore environment in Toguchi and Nishime (2013) and Toguchi et al. (2016), ~~parallel to~~ songs such as Tanchamē
622 (谷茶前) and Umi nu Chinbōrā (海ぬチンボーラー) that make observations of ~~nearshore-shallow~~ sardine and cone snail
623 species, respectively (Seki, 2024). These commonly performed ~~songs numbers~~ (Hanashiro, 2007) may ~~collectively link~~
624 ~~places with~~ highlight local hydrological, biological, and geological phenomena to familiarize Okinawans ~~a populations~~ with
625 their ~~local~~ environment. Therefore, future work in preserving and compiling ~~indigenous~~ Indigenous knowledge within
626 ~~Ryukyuan songthes Ryukyuan arts~~ could be key for ~~future~~ place-based ~~science~~ engagement across the Okinawan
627 community in the Ryukyu Islands.

628 **54.3 Empowering Okinawan communities**

629 Incorporating Nubui Kuduchi and Kudai Kuduchi in geoscience engagement can (e.g., Kaneshiro, 2002; Ueunten,
630 ~~1989)~~ uplift Ryukyuan culture, language, and indigeneity against the backdrop of historical marginalization. Okinawan
631 diasporas have a unique opportunity to connect with other Indigenous Peoples who have had successful experiences with
632 place-based geoscience education (e.g., Hawai'i; Chinn et al., 2014; Gibson and Puniwai, 2006). In fact, Native
633 ~~Hawaiian 1960s and~~ revitalization and sovereignty movements have directly influenced parallel efforts to revitalize
634 Okinawan culture and languages (e.g., Heinrich, 2018; Kina, 2020). Conversations between the highly active Hawai'i-
635 Okinawa diaspora, Okinawans in Okinawa Prefecture, and the Native Hawaiian community have facilitated cross-cultural
636 exchange towards Okinawan cultural resurgence (e.g., LooChoo Identity Summit, where LooChoo is an approximation for
637 one Ryukyuan language's pronunciation of Ryukyu; Ohara and Slevin, 2019). Further collaborations in place-based
638 pedagogy within these preexisting relationships may help legitimize Ryukyuan Indigenous knowledge and grow this
639 Indigenous movement.

640 ~~Utilizing Ryūkyū koten in science has the potential to address environmental and societal issues in 21st-century Okinawa~~
641 ~~Prefecture. The Ryukyu Islands will likely face challenges due to anthropogenic climate change, including coastal flooding,~~

642 typhoon intensification, and coral bleaching (IPCC, 2023). Likewise, Okinawa Prefecture faces a stagnant college
643 matriculation rate and low standardized test scores relative to the whole of Japan (Kakazu, 2012). These statistics must be
644 contextualized within the history of discriminatory and assimilationist education policies implemented by the Japanese
645 government after annexation with the goal of eliminating Ryukyuan languages and cultures (Hammime, 2019). Research in
646 science education finds that such marginalization can preclude the next generation of marginalized people from entering
647 environmental studies and careers (e.g., Martin and Fisher Ari, 2021; Padgett, 2001). More positive representations of
648 indigenous knowledge are likely key to science engagement and retention efforts in Okinawa (Semken et al., 2017).
649 Consequently, increased visibility of *Ryūkyū koten* may stimulate novel research on the prefecture's climate future, expose
650 students to the utilities of indigenous knowledge, and refocus ancestral arts and culture towards the issues that impact 21st-
651 century Okinawans (e.g., Alexiades et al., 2021; Chinn et al., 2014; Gibson and Puniwai, 2006; Reano and Ridgway, 2015).

652 Such place based goals follow contemporary endeavors to recognize Ryukyuan indigeneity, particularly against the
653 backdrop of marginalization (e.g., Abe, 2023; Hammime, 2019; Nishiyama, 2023). Works in the similarly subtropical
654 Hawaiian Islands provide ample precedent for utilizing marginalized, indigenous, and Native Hawaiian knowledge in
655 teaching about place-based environmental science (e.g., Chinn et al., 2014; Gibson and Puniwai, 2006; Lemus et al., 2014;
656 Seraphin, 2014; Wiener and Matsumoto, 2014). In fact, the Native Hawaiian Renaissance movement of the late 1900s,
657 during which Hawaiian culture experienced a resurgence amid historical marginalization, provided a direct influence on
658 parallel efforts in 21st-century Okinawa Prefecture (e.g., Heinrich, 2018; Kina, 2020). Collaborations therein between the
659 Okinawan diaspora in Hawai'i, Okinawans in Okinawa Prefecture, and the Native Hawaiian community facilitate cross-
660 cultural exchange towards these cultural revitalization endeavors (Ohara and Slevin, 2019). Furthermore, the Hawai'i
661 Okinawa diaspora and those across the Americas (e.g., conterminous USA, Brazil, Peru) also work towards propagating
662 *Ryūkyū koten* and other Ryukyuan arts (e.g., Izumi, 2020; Kaneshiro, 2002; Miyashiro, 2018; Olsen, 1980, 1982; Sutton,
663 1983; Teruya, 2014; Ueunten, 1989). These practitioners are often separated from Okinawa by three or more generations in
664 the 20th-21st centuries and may not understand Ryukyuan languages, and therefore *Ryūkyū koten* lyrics (e.g., Ueunten, 1989).
665 This population, looking to connect with their distant homeland, may be an additional audience for Ryukyuan science
666 engagement through a place-based lens by ancestry rather than locality (Semken et al., 2017). Thus, advancements in *Ryūkyū*
667 *koten* and place-based pedagogy may help develop the global Ryukyuan indigenous movement.

668 Likewise, Okinawa Prefecture faces a stagnant college matriculation rate and low standardized test scores relative to the
669 whole of Japan (Kakazu, 2012). These statistics must be contextualized within the history of discriminatory and
670 assimilationist education policies implemented by the Japanese government after annexation with the goal of eliminating
671 Ryukyuan languages and cultures (Hammime, 2019). Research in science education finds that such marginalization can
672 preclude the next generation of marginalized people from entering environmental studies and careers (e.g., Martin and
673 Fisher Ari, 2021; Padgett, 2001). More positive representations of indigenous knowledge are likely key to science
674 engagement and retention efforts in Okinawa (Semken et al., 2017). Consequently, increased visibility of *Ryūkyū koten* may
675 stimulate novel research on the prefecture's climate future, expose students to the utilities of indigenous knowledge, and

~~refocus ancestral arts and culture towards the issues that impact 21st-century Okinawans (e.g., Alexiades et al., 2021; Chinn et al., 2014; Gibson and Puniwai, 2006; Reano and Ridgway, 2015).~~

~~Such place based goals follow contemporary endeavors to recognize Ryukyuan indigeneity, particularly against the backdrop of marginalization (e.g., Abe, 2023; Hammine, 2019; Nishiyama, 2023). Works in the similarly subtropical Hawaiian Islands provide ample precedent for utilizing marginalized, indigenous, and Native Hawaiian knowledge in teaching about place-based environmental science (e.g., Chinn et al., 2014; Gibson and Puniwai, 2006; Lemus et al., 2014; Seraphin, 2014; Wiener and Matsumoto, 2014). In fact, the Native Hawaiian Renaissance movement of the late 1900s, during which Hawaiian culture experienced a resurgence amid historical marginalization, provided a direct influence on parallel efforts in 21st-century Okinawa Prefecture (e.g., Heinrich, 2018; Kina, 2020). Collaborations therein between the Okinawan diaspora in Hawai'i, Okinawans in Okinawa Prefecture, and the Native Hawaiian community facilitate cross-cultural exchange towards these cultural revitalization endeavors (Ohara and Slevin, 2019). Furthermore, the Hawai'i-Okinawa diaspora and those across the Americas (e.g., conterminous USA, Brazil, Peru) also work towards propagating *Ryūkyū koten* and other Ryukyuan arts (e.g., Izumi, 2020; Kaneshiro, 2002; Miyashiro, 2018; Olsen, 1980, 1982; Sutton, 1983; Teruya, 2014; Ueuntan, 1989). These practitioners are often separated from Okinawa by three or more generations in the 20th-21st-centuries and may not understand Ryukyuan languages, and therefore *Ryūkyū koten* lyrics (e.g., Ueuntan, 1989). This population, looking to connect with their distant homeland, may be an additional audience for Ryukyuan science engagement through a place-based lens by ancestry rather than locality (Semken et al., 2017). Thus, advancements in *Ryūkyū koten* and place-based pedagogy may help develop the global Ryukyuan indigenous movement.~~

~~4 Lessons for science engagement~~

~~It is important for this this and any future research RKO works to credit-empower indigenousIndigenous practitioners, ensure rightful recognition, and present accurate interpretations. For example, many Ryukyuan songs that describe nature are steeped in metaphor, including that of human relationships (e.g., Karaya Bushi; 瓦屋節), political rebellion (e.g., Unna Bushi; 恩納節), and homesickness (e.g., Chijuyā; 浜千鳥; Sakiyama and Oshiro, 1995; Seki, 2024). These factors often make scientific interpretations difficult (e.g., Swanson, 2008), but can be overcome by continued engagement-collaborations with indigenousIndigenous elders and scholars (Younging, 2018); similar to how J.Y. Uyeuntan and K.A. Odo guided theour interpretations of Nubui Kuduchi and Kudai Kuduchi (Younging, 2018)presented here (Sect. 4). Although it is challenging to compare poetic observations from songs with those-scientific observations from literature, the ability to experience the same environmental conditions as sung therein can enhance hands-on and place-based science engagement in the 21st century. Further-Future collaborations with Ryūkyū kotenRKO leaders-are required to interpret additional songs and develop engagement modules for this purpose (Sect. 4.5.2). As such, there is; with-great potential-for more partnerships between the cultural-Ryukyuan arts practitioners and geoscienceScientists engagement in environmental research.~~

Nonetheless, song to place connections have a healthy and contemporary appreciation across Okinawa Prefecture. For example, stone monuments to transformative *Ryūkyū koten* and folk songs, called *kahi* (歌碑), are often installed where songs have some lyrical or historical connection to a place; these sites may function as community centers, artistic venues, and memorials to collective Okinawan experiences, such as World War II (Gillan, 2017). Building off these preexisting ideals that value the concept of place is vital for establishing culture's role in 21st-century science engagement (Lanza and Negrete, 2007). Such efforts have stimulated and will likely continue to stimulate novel research across Earth science disciplines, including climate science (e.g., Businger et al., 2018; Hinzman et al., 2005; Turner and Reid, 2022), volcanology (e.g., Swanson, 2008), and seismology (e.g., Ludwin et al., 2005). Likewise, invoking history and geoheritage can help researchers protect scientifically and historically important geosites (e.g., Motta and Motta, 2007; Reano and Ridgway, 2015) and teach natural disaster preparedness (e.g., Bailey Winiata et al., 2024). These efforts to relate familiar culture with complex research provide accessible narratives for more effective science communication (Lanza and Negrete, 2007), solidifying indigenous knowledge and place-based science as key for environmental science engagement and education.

6.5 Conclusions

Ryūkyū koten RKO contains historical observations of the natural world that describe atmospheric, oceanic, and geologic processes. Here, we demonstrate how Nubui Kuduchi and Kudai Kuduchi hold 18th-century descriptions of winds, currents, typhoons, and volcanoes in the ~~western Pacific~~ Ryukyu Islands of the western Pacific. Through a novel collaborations with cultural practitioners, ~~these observations~~ we show that observations of the natural world in lyrics correspond with climate and volcanological research in 20th–21st-century scientific literature. Such correspondence suggests that Indigenous knowledge in these songs can be used to ~~can be explored as climate and geology benchmarks to~~ better engage Okinawans in Okinawa Prefecture and across the global Okinawan diaspora with complex geoscience topics applicable to their communities. Such benchmarks are likely useful for contextualizing environmental phenomena from past to present, such as the impacts of anthropogenic climate change. ~~Researchers and educators can apply these lessons to~~ place-based science modules centered on science engagement, cultural revitalization, and the specific climate, and geology, and social issues facing 21st-century Okinawa-~~ns~~ Prefecture. Thus, ~~documentation of this performing arts tradition~~ RKO is is pedagogically ~~scientifically and pedagogically~~ vital for promoting ~~valuable and could reveal~~ science engagement in and about ~~the more environmental lessons from the~~ Ryukyu Islands.

Data availability

Data produced ~~for in~~ this project consists of two video supplements ~~of for~~ Nubui Kuduchi and Kudai Kuduchi (Higa et al., 2024a, b).

736 **Video supplement**

737 See video supplement for documentation of Nubui Kuduchi and Kudai Kuduchi lyrics, translations, and interpretations (Higa
738 et al., 2024a, b).

739 **Author contribution**

740 Conceptualization: JTH, Data curation: JTH, Formal analysis: JTH, JYU, KAO, Funding acquisition: JTH, Investigation:

758 the founder of the Ryukyu Koten Afuso Ryu Ongaku Kenkyu Choichi Kai USA, Master Instructor G.S. Murata, for support,
759 We are also grateful to the Hooge Ryu Hana Nuuzi no Kai Nakasone Dance Academy and Master Instructors J. Okamura
760 and L. Nakandakari for their permission to adapt translations and interpretations by the late C.T. Nakasone ~~of the Hooge Ryu~~

- 761 ~~Hana Nuuzi no Kai Nakasone Dance Academy for translations and interpretations, and Master Instructors J. Okamura and L.~~
 762 ~~Nakandakari of the aforementioned dance academy for permission to adapt these translations and interpretations.~~
