Text S1.

The formation, photolysis, scavenging, and gas-particle partitioning processes of HOMs-SOA are detailed introduced as follows.

1. Monoterpene oxidation

The new branching which forms RO₂ that can undergo autoxidation are included in the original monoterpene + OH/O₃ reactions, as shown in Table S1 and S2. The HOMs-SOA formed by the initial oxidation between monoterpenes and NO₃ radical are not considered here because the branching ratio may be very low and remain large uncertainties (Roldin et al., 2019), although the NO₃-initiated HOMs-SOA are reported and may be significant in the nighttime (Nah et al., 2016; Yan et al., 2016). The APINO₂, BPINO₂, LIMONO₂, and MYRCO₂ are the original formed RO₂ that cannot form HOMs. Here we used high branching ratios in the generation of MT-bRO₂ as shown in Table S3 in Xu et al. (2022). The branching ratios of the yield of MT-aRO₂ to the yield of MT-bRO₂ ($f_{\text{MT-aRO}_2}/f_{\text{MT-bRO}_2}$) for the monoterpenes + OH reaction is 0.25:0.75. The $f_{\text{MT-aRO}_2}/f_{\text{MT-bRO}_2}$ for the monoterpenes + O₃ reaction is 0.92:0.08. All the branching ratios used here are within the ranged used in the previous studies. The yields range of MT-bRO₂ formed by monoterpenes + OH and monoterpenes + O₃ are 0.075 ~ 0.83 (Lee et al., 2023; Piletic and Kleindienst, 2022; Pye et al., 2019; Weber et al., 2020; Xu et al., 2019) and 0 ~ 0.22 (Ehn et al., 2014; Jokinen et al., 2015; Roldin et al., 2019), respectively. The reaction rate constants are the same as the default monoterpenes + OH/O₃ reactions.

Table S1. initial oxidation between monoterpenes and OH radical

Index	Reactions	Reaction rate
1	APIN + OH → 0.25*APINO ₂ + 0.75*MT-bRO ₂	1.34e-11*exp(410/T)
2	BPIN + OH → 0.25*BPINO ₂ + 0.75*MT-bRO ₂	1.62e-11*exp(460/T)
3	LIMON + OH → 0.25*LIMONO ₂ + 0.75*MT-bRO ₂	3.41e-11*exp(470/T)
4	MYRC + OH → 0.25*MYRCO ₂ + 0.75*MT-bRO ₂	2.1e-10

Table S2. initial oxidation between monoterpenes and O₃

Index	Reactions	Reaction rate
5	APIN + O ₃ → 0.736*APINO ₂ + 0.064*MT-bRO ₂ + 0.77*OH + 0.066*TERPA2O ₂ + 0.22*H ₂ O ₂ + 0.044*TERPA + 0.002*TERPACID + 0.034*TERPA2 + 0.17*HO ₂ + 0.17*CO + 0.27*CH ₂ O + 0.054*TERPA2CO ₃	1.34e-11* exp(410/T)

6	$\text{BPIN} + \text{O}_3 \rightarrow$ $0.736*\text{BPINO}_2 + 0.064*\text{MT-bRO}_2 + 0.102*\text{TERPK} + 0.3*\text{OH} +$ $0.06*\text{TERPA2CO}_3 + 0.32*\text{H}_2\text{O}_2 + 0.038*\text{BIGALK} + 0.19*\text{CO}_2 +$ $0.81*\text{CH}_2\text{O} + 0.11*\text{HMHP} + 0.08*\text{HCOOH}$	$1.62\text{e-}11*$ $\exp(460/T)$
7	$\text{LIMON} + \text{O}_3 \rightarrow$ $0.736*\text{LIMONO}_2 + 0.064*\text{MT-bRO}_2 + 0.66*\text{OH} + 0.132*\text{TERPF1} +$ $0.33*\text{CH}_3\text{CO}_3 + 0.33*\text{CH}_2\text{O} + 0.066*\text{TERPA3CO}_3 + 0.33*\text{H}_2\text{O}_2 +$ $0.002*\text{TERPACID}$	$3.41\text{e-}11*$ $\exp(470/T)$
8	$\text{MYRC} + \text{O}_3 \rightarrow$ $0.736*\text{MYRCO}_2 + 0.064*\text{MT-bRO}_2 + 0.2*\text{TERPF2} + 0.63*\text{OH} +$ $0.63*\text{HO}_2 + 0.25*\text{CH}_3\text{COCH}_3 + 0.39*\text{CH}_2\text{O} + 0.18*\text{HYAC}$	$2.1\text{e-}10$

2. Autoxidation

The MT-bRO₂ will undergo fast intramolecular reactions. The hydrogen-atom is shifted to form an alkyl radical where O₂ rapidly attaches to form a more oxidized RO₂ radical, which is called autoxidation. The MT-bRO₂ may go through several generations of autoxidation reaction. The autoxidation reactions of MT-bRO₂ are lumped into two generations as shown in Table S3, where the reaction rate is temperature-dependent (Berndt et al., 2016; Xu et al., 2022). The activation energies are 74.1 kJ/mol which are within in the range from previous studies (Lee et al., 2023; Moller et al., 2020; Pye et al., 2019; Roldin et al., 2019; Schervish and Donahue, 2020; Xu et al., 2019).

Table S3. autoxidation reaction

Index	Reactions	Reaction rate
9	$\text{MT-bRO}_2 \rightarrow \text{MT-cRO}_2$	$9.8\text{e}12*\exp(-8836/T)$
10	$\text{MT-cRO}_2 \rightarrow \text{MT-HOM-RO}_2$	$9.8\text{e}12*\exp(-8836/T)$

3. Self- and cross-reactions for accretion products

Due to isomers of MT-RO₂ and ISOP-RO₂, 64 self- and cross-reactions are added (Table S4), where three branches are considered for the products. First, the intermediate products are produced and are lumped as C₁₀-ROH and C₁₀-CBYL. Second, RO radicals are generated, and may produce HO₂ and C₁₀-CBYL or decompose into smaller compounds. Half of the RO are assumed to decompose into smaller carbonyls. Third, accretion products (SOAGac20 and SOAGac15) are produced. The branching ratios of the three pathways above were set as 0.29:0.67:0.04, respectively (Xu et al., 2022). However, for the self- and cross-reactions involving MT-aRO₂ (APINO₂, BPINO₂, LIMONO₂, and MYRCO₂) and ISOP-RO₂, a small fraction of RO radicals are possible to undergo a unimolecular H-shift to form MT-bRO₂, and the branching ratio are set to 0.05 (Xu et al., 2022). The fast reaction rate are applied here based on Table S4 in Xu et al. (2022).

Table S4. self- and cross-reactions to form gas-phase accretion products

4. MT-RO₂ reactions with methylperoxy/peroxyacetyl radicals

As shown in Table S5, the reactions between original MT-RO₂ and CH₃O₂/CH₃CO₃ are modified based on Xu et al. (2022) to consider the branch to form MT-bRO₂. The rate constants remain unchanged. When MT-bRO₂, MT-cRO₂, and MT-HOM-RO₂ are terminated by methylperoxy/peroxyacetyl radicals, C₁₀-ROH, C₁₀-CBYL, and some small molecules are generated. The rate constants are the same as Xu et al. (2022).

Table S5. MT-RO₂ reactions with methylperoxy/peroxyacetyl radicals

Index	Reactions	Reaction rate
81	APINO ₂ + CH ₃ CO ₃ → 0.05*MT-bRO ₂ + 0.3705*TERPA + 0.3325*TERPA3 + 0.133*TERP1OOH + 0.12*CH ₃ COCH ₃ + 0.114*TERPF1 + 0.27*CH ₂ O + HO ₂ + CH ₃ O ₂ + CO ₂	2e-12* exp(500/T)

87	MYRCO ₂ + CH ₃ CO ₃ → 0.05*MT-bRO ₂ + 0.95*TERPF2 + HO ₂ + 0.46*CH ₃ COCH ₃ + 0.42*CH ₂ O + CH ₃ O ₂ + CO ₂	2e-12* exp(500/T)
88	MYRCO ₂ + CH ₃ O ₂ → 0.05*MT-bRO ₂ + 0.25*CH ₃ OH + 0.95*TERPF2 + 0.75*CH ₂ O + HO ₂	2e-12
89–91	MT-bRO ₂ \ MT-cRO ₂ \ MT-HOM-RO ₂ + CH ₃ O ₂ → 0.15*CH ₃ OH + 0.85*CH ₂ O + 1.4*HO ₂ + 0.7*HYDRALD + 0.7*CH ₃ COCH ₃ + 0.15*C ₁₀ -ROH + 0.15*C ₁₀ -CBYL	3.56e-14* exp(708/T)
92–94	MT-bRO ₂ \ MT-cRO ₂ \ MT-HOM-RO ₂ + CH ₃ CO ₃ → 0.7*CH ₃ O ₂ + 0.7*HO ₂ + 0.7*HYDRALD + 0.7*CH ₃ COCH ₃ + 0.3*CH ₃ COOH + 0.15*C ₁₀ -ROH + 0.15*C ₁₀ -CBYL	7.4e-13* exp(765/T)

5. MT-RO₂ reactions with NO/NO₃

As shown in Table S6, the reactions between original MT-aRO₂ and NO/NO₃ are modified based on Xu et al. (2022) to consider the branch to form MT-bRO₂. The rate constants remain unchanged. The MT-bRO₂\MT-cRO₂ + NO reactions are similar as the default MT-aRO₂ + NO reactions. The MT-bRO₂\MT-cRO₂ + NO₃/HO₂ reactions are based on Xu et al. (2022).

Table S6. MT-RO₂ reactions with NO/NO₃

Index	Reactions	Reaction rate

	0.06*CH ₃ COCH ₃ + 0.06*TERPF1 + 0.08*CH ₂ O + 0.25*TERP1OOH + 0.48*HO ₂ + 0.4*TERPOOH + 0.29*TERPA + 0.35*OH	2.6e-13*exp(1300/T)

6. C₁₀ HOMs formation

When MT-HOM-RO₂ are oxidized by HO₂/NO/NO₃, three kinds of gas-phase C₁₀ HOMs are formed: two kinds of C₁₀ non-nitrate HOMs (SOAGhma and SOAGhmb) and C₁₀ nitrate HOMs (SOAGhmn), as shown in Table S7. The rate constants are the same as MT-RO₂ + HO₂/NO/NO₃ reactions in Xu et al. (2022).

Table S7. C₁₀ HOMs formation

Index	Reactions	Reaction rate
109	MT-HOM-RO ₂ + HO ₂ → SOAGhma + O ₂	1.5e-11
110	MT-HOM-RO ₂ + NO → 0.8*NO ₂ + 0.8*HO ₂ + 0.4*SOAGhmb + 0.8*HYDRALD + 0.2*SOAGhmn	4.0e-12
111	MT-HOM-RO ₂ + NO ₃ → HO ₂ + NO ₂ + 0.5*SOAGhmb + HYDRALD	1.2e-12

7. Photolysis

Only particle-phase C₁₀ HOMs undergo photolysis process (Table S8). The photolysis rate of C₁₀ HOMs is fast and set as about 1/60 of NO₂ photolysis rate (Xu et al., 2022).

Table S8. Photolysis of particle-phase C₁₀ HOMs

Index	reactions	rate constant
112–117	soahma_a1\ soahma_a2\ soahmb_a1\ soahmb_a2\ soahmn_a1\ soahmn_a2\ + hv →	0.017*jno2

8. Chemical loss of intermediate products

Three kinds of intermediate products (C₁₀-CBYL, C₁₀-ROH, and ROH) will react with OH radical (Table S9). Among them, C₁₀-CBYL and C₁₀-ROH will be transferred into MT-RO₂. The rate constant is the same as Xu et al. (2022).

Table S9. Chemical loss of C₁₀-CBYL and C₁₀-ROH

Index	Reactions	Reaction rate
118	C ₁₀ -CBYL + OH → 0.125*APINO ₂ + 0.125*BPINO ₂ + 0.125*MYRCO ₂ + 0.125*LIMONO ₂ + 0.475*MT-bRO ₂ + 0.025*MT-cRO ₂	4.6e-12*exp(70/T)
119	C ₁₀ -ROH + OH → 0.125*APINO ₂ + 0.125*BPINO ₂ + 0.125*MYRCO ₂ + 0.125*LIMONO ₂ + 0.475*MT-bRO ₂ + 0.025*MT-cRO ₂	4.6e-12*exp(70/T)
120	ROH + OH → HO ₂ + CH ₃ COCH ₃	4.6e-12*exp(70/T)

9. Wet and dry deposition of newly added species

All the newly added SOAG and SOA follows the same deposition processes with the original SOA and SOAG in VBS approach. ROH and MT-RO₂ do not go through both wet and dry deposition processes. The C₁₀-CBYL and C₁₀-ROH are dry and wet deposited using the same parameters as acetic acid (Xu et al., 2022).

Figure S1. The diurnal cycle of simulated (black solid lines) and observed (black dots) surface (a) monoterpenes, (b) isoprene, (c) NO, (d) O₃, and (e) OH radical concentrations at the Centreville site. The ratio of the observed monoterpenes to the simulated monoterpenes (R_{MT}) are shown in red dashed line.

Figure S2. Same as Figure S1, but at the SMEAR II site.

Figure S3. 2013 annual averaged surface (a) MTSOA and (b) SOA concentrations (unit: $\mu\text{g}/\text{m}^3$) in Control experiment (Table 2).

Figure S4. 2013 annual averaged surface (a) MTERP emissions (unit: $\mu\text{g}/\text{m}^2/\text{s}$), (b) ISOP emissions (unit: $\mu\text{g}/\text{m}^2/\text{s}$), (c) NO concentration (unit: ppbv) in Control experiment.

Figure S5. 2013 seasonal cycle of surface (a) monoterpenes and (b) isoprene emissions over global (grey lines), CONUS (blue lines) and China (orange lines) in Control experiment. The global monoterpenes and isoprene emissions are multiplied by a factor of 2. The Amazon monoterpenes and isoprene emissions are multiplied by a factor of 1/4. The global and Amazon NO concentration have been multiplied by a factor of 2.

Figure S6. 2013 seasonal cycle of surface $\text{C}_{10}\text{-NON}$ (pink), $\text{C}_{10}\text{-ON}$ (red), C_{15} (yellow), and C_{20} (orange) concentrations over (a) global, (b) CONUS, (c) China, and (d) Amazon regions in Control experiment.

Table S10. 2013 annual (ANN), June-July-August (JJA), and August-September-October (ASO) average HOMs-SOA components' concentrations and their contributions over global, CONUS, China, AMZ, SEUS, and SECN regions in Control experiment. ASO represents the wet season in AMZ.

Region	Global		CONUS		China		AMZ		SEUS		SECN	
Period	ANN	JJA	ANN	JJA	ANN	JJA	ANN	ASO	ANN	JJA	ANN	JJA
Concentrations ($\mu\text{g}/\text{m}^3$)

Table S12. Species for HOMs-SOA formation mechanism.

Species	Molecular formula	Description
APIN ^b	C ₁₀ H ₁₆	α -pinene
BPIN ^b	C ₁₀ H ₁₆	β -pinene
LIMON ^b	C ₁₀ H ₁₆	Limonene
MYRC ^b	C ₁₀ H ₁₆	Myrcene
APINO ₂ ^b	C ₁₀ H ₁₇ O ₃	peroxy radical from OH + α -pinene reaction
BPINO ₂ ^b	C ₁₀ H ₁₇ O ₃	peroxy radical from OH + β -pinene reaction
LIMONO ₂ ^b	C ₁₀ H ₁₇ O ₃	peroxy radical from OH + limonene
MYRCO ₂ ^b	C ₁₀ H ₁₇ O ₃	peroxy radical from OH + myrcene
ISOPBIO ₂ ^b	C ₅ H ₉ O ₃	OH-1-O ₂ -2--isoprene hydroxy peroxy radical
ISOPZDIO ₂ ^b	C ₅ H ₉ O ₃	OH-1-O ₂ -4-Z--isoprene hydroxy peroxy radical
ISOPZD4O ₂ ^b	C ₅ H ₉ O ₃	OH-4-O ₂ -1-Z--isoprene hydroxy peroxy radical
ISOPEDIO ₂ ^b	C ₅ H ₉ O ₃	OH-1-O ₂ -4-E--isoprene hydroxy peroxy radical
ISOPED4O ₂ ^b	C ₅ H ₉ O ₃	OH-4-O ₂ -1-E--isoprene hydroxy peroxy radical
ISOPB4O ₂ ^b	C ₅ H ₉ O ₃	OH-4-O ₂ -3--isoprene hydroxy peroxy radical
MT-bRO ₂ ^a	C ₁₀ H ₁₆ O ₄	RO ₂ from monoterpene+O ₃ /OH that can undergo autoxidation
MT-cRO ₂ ^a	C ₁₀ H ₁₆ O ₆	RO ₂ from MT-bRO ₂ autoxidation
MT-HOM-RO ₂ ^a	C ₁₀ H ₁₆ O ₈	RO ₂ from MT-cRO ₂ autoxidation
SOAGhma ^a	C ₁₀ H ₁₄ O ₉	gas-phase C ₁₀ HOMs product without nitrate from HO ₂ reaction
SOAGhmb ^a	C ₁₀ H ₁₄ O ₉	gas-phase C ₁₀ HOMs product without nitrate from NO and NO ₃ reaction
SOAGhmn ^a	C ₁₀ H ₁₄ O ₉ N	gas-phase C ₁₀ HOMs product with nitrate from NO reaction
SOAGac15 ^a	C ₁₅ H ₁₈ O ₇	gas-phase C ₁₅ accretion product from isoprene-derived RO ₂ (ISOP-RO ₂) + MT-RO ₂
SOAGac20 ^a	C ₂₀ H ₃₂ O ₈	gas-phase C ₂₀ accretion product from MT-RO ₂ + MT-RO ₂
soahma_a1	C ₁₀ H ₁₄ O ₉	particle-phase C ₁₀ HOMs product without nitrate from HO ₂ reaction in accumulation mode
soahma_a2	C ₁₀ H ₁₄ O ₉	particle-phase C ₁₀ HOMs product without nitrate from HO ₂ reaction in Aitken mode
soahmb_a1	C ₁₀ H ₁₄ O ₉	particle-phase C ₁₀ HOMs product without nitrate from NO and NO ₃ reaction in accumulation mode
soahmb_a2	C ₁₀ H ₁₄ O ₉	particle-phase C ₁₀ HOMs product without nitrate from NO and NO ₃ reaction in Aitken mode
soahmn_a1	C ₁₀ H ₁₄ O ₉ N	particle-phase C ₁₀ HOMs product with nitrate from NO reaction in accumulation mode
soahmn_a2	C ₁₀ H ₁₄ O ₉ N	particle-phase C ₁₀ HOMs product with nitrate from NO reaction in Aitken mode
soaac15_a1	C ₁₅ H ₁₈ O ₇	particle-phase C ₁₅ accretion product from isoprene-derived RO ₂ (ISOP-RO ₂) + MT-RO ₂ in accumulation mode
soaac15_a2	C ₁₅ H ₁₈ O ₇	particle-phase C ₁₅ accretion product from isoprene-derived RO ₂ (ISOP-RO ₂) + MT-RO ₂ in Aitken mode
soaac20_a1	C ₂₀ H ₃₂ O ₈	particle-phase C ₂₀ accretion product from MT-RO ₂ + MT-RO ₂ in accumulation mode
soaac20_a2	C ₂₀ H ₃₂ O ₈	particle-phase C ₂₀ accretion product from MT-RO ₂ + MT-RO ₂ in Aitken mode
ROH ^a	C ₃ H ₈ O	lumped alcohols with more than 2 carbons
C ₁₀ -CBYL ^a	C ₁₀ H ₁₇ O ₃	Carbonyl with 10 carbon atoms
C ₁₀ -ROH ^a	C ₁₀ H ₁₇ O ₃	Alcohol with 10 carbon atoms
BIGALK	C ₅ H ₁₂	lumped alkanes C>3
CO ^b	CO	carbon monoxide
CO ₂ ^b	CO ₂	carbon dioxide

CH ₂ O ^b	CH ₂ O	formaldehyde
CH ₃ O ₂ ^b	CH ₃ O ₂	methylperoxy radical
CH ₃ CO ₃ ^b	CH ₃ CO ₃	acetylperoxy radical
CH ₃ COCH ₃ ^b	CH ₃ COCH ₃	acetone
CH ₃ COOH ^b	CH ₃ COOH	acetic acid
CH ₃ OH ^b	CH ₃ OH	methanol
HO ₂ ^b	HO ₂	hydroperoxyl radical
H ₂ O ₂ ^b	H ₂ O ₂	hydrogen peroxide
HCOOH ^b	HCOOH	formic acid
HMHP ^b	CH ₄ O ₃	hydroxy methyl hydroperoxide
HYAC ^b	CH ₃ COCH ₂ OH	hydroxyacetone
HYDRALD ^b	HOCH ₂ CCH ₃ CHCHO	lumped unsaturated hydroxycarbonyl
TERP1OOH ^b	C ₁₀ H ₁₈ O ₃	terpene-derived hydroxy hydroperoxide with 1 double bond
TERPA ^b	C ₁₀ H ₁₆ O ₂	aldehyde terpene product with no double bonds that contains a ring like pinonaldehyde
TERPACID ^b	C ₁₀ H ₁₆ O ₄	carboxylic acid/peracid from TERPA
TERPA2 ^b	C ₉ H ₁₄ O ₂	TERPA oxidation product with no double bonds that contains an aldehydic group
TERPA2O ₂ ^b	C ₉ H ₁₅ O ₄	TERPA peroxy radical 2nd step
TERPA2CO ₃ ^b	C ₉ H ₁₃ O ₄	acyl peroxy radical from TERPA2
TERPA3 ^b	C ₉ H ₁₄ O ₃	aldehyde terpene product with no ring like limonaldehyde
TERPA3CO ₃ ^b	C ₉ H ₁₃ O ₅	acyl peroxy radical from TERPA3
TERPF1 ^b	C ₁₀ H ₁₆ O ₂	functionalized terpene product with 1 double bond typically containing carbonyl groups
TERPF2 ^b	C ₇ H ₁₀ O	functionalized terpene product with 2 double bonds typically containing carbonyl groups
TERPHFN ^b	C ₁₀ H ₁₉ NO ₇	terpene highly functionalized nitrate
TERPK ^b	C ₉ H ₁₄ O	terpene product containing a ketone group
TERPNS ^b	C ₁₀ H ₁₇ NO ₄	terpene-derived saturated secondary or primary nitrate
TERPNS1 ^b	C ₁₀ H ₁₇ NO ₄	terpene-derived unsaturated secondary or primary nitrate
TERPNT ^b	C ₁₀ H ₁₇ NO ₄	terpene-derived saturated tertiary nitrate
TERPNT1 ^b	C ₁₀ H ₁₇ NO ₄	terpene-derived unsaturated tertiary nitrate
