

Supplements to Detailed Response to Reviewer

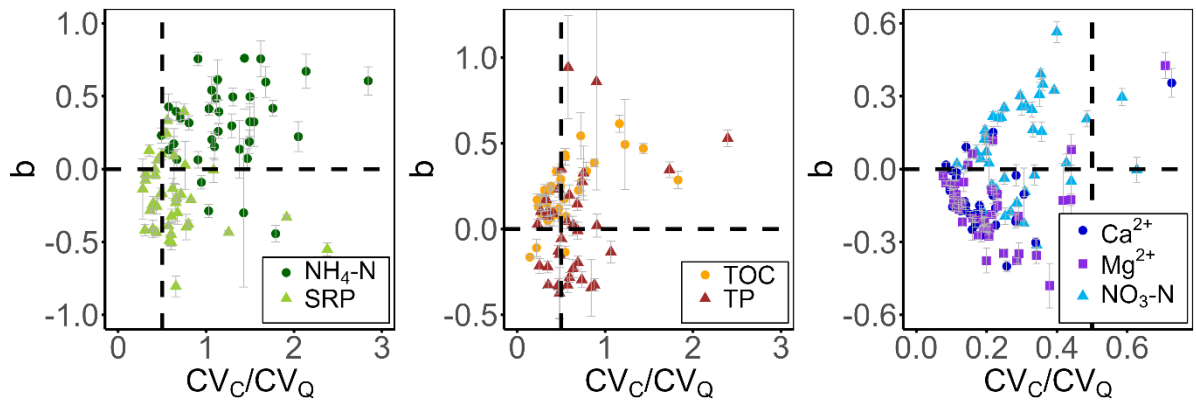

Figure 2: Illustration of the SEM for \blacktriangle SRP, \bullet $\text{NH}_4\text{-N}$, \blacktriangle TP, \bullet TOC, \blacktriangle $\text{NO}_3\text{-N}$, \bullet Ca^{2+} and \blacksquare Mg^{2+} clusters, with error bars representing ± 1 standard error. Clusters represent temporal-dynamic solutes (green, left), short-term stable solutes (yellow/brown, middle), and long-term stable solutes (blue/violet, right). The vertical line separates chemostatic (left) from chemodynamic behaviour (right), while the horizontal line distinguishes enrichment (top) from dilution (bottom) patterns.

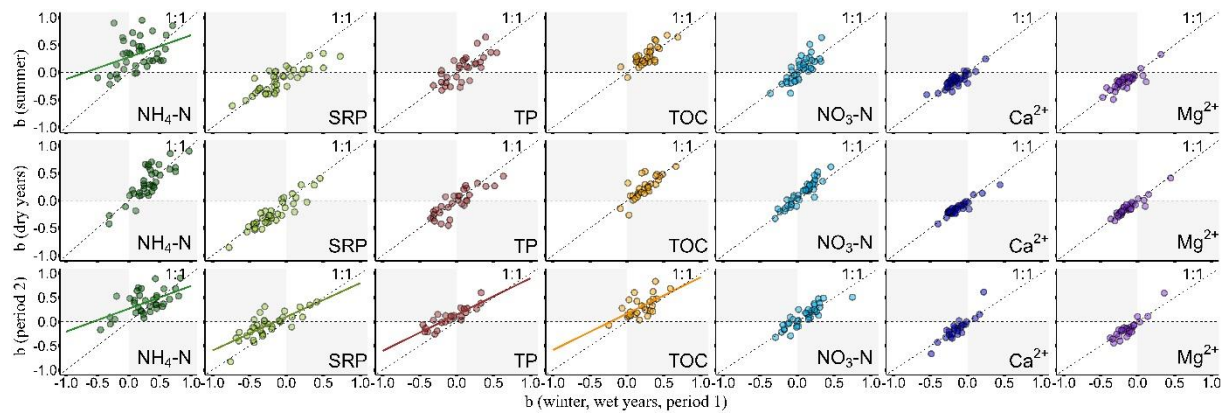

Figure 1: Differences in solute export mechanisms for $\text{NO}_3\text{-N}$, $\text{NH}_4\text{-N}$, SRP, TP, TOC, Ca, and Mg in response to temporal changes. Differences in solute export mechanisms: (top) summer and winter, (middle) dry years and wet years and (bottom) Period 2 and Period 1. Dots represent individual catchments. b = solute export mechanisms ($b < 0$: dilution; $b > 0$: enrichment behaviour). Regression lines included for significant temporal differences ($p < 0.05$ and $p < 0.1$ for TOC). Points above the 1:1 line indicate an increase in enrichment or a decrease in dilution behaviour, whereas points below the 1:1 line indicate a less pronounced enrichment or an increased dilution export pattern respectively. The gray areas indicate a directional shift in solute export.

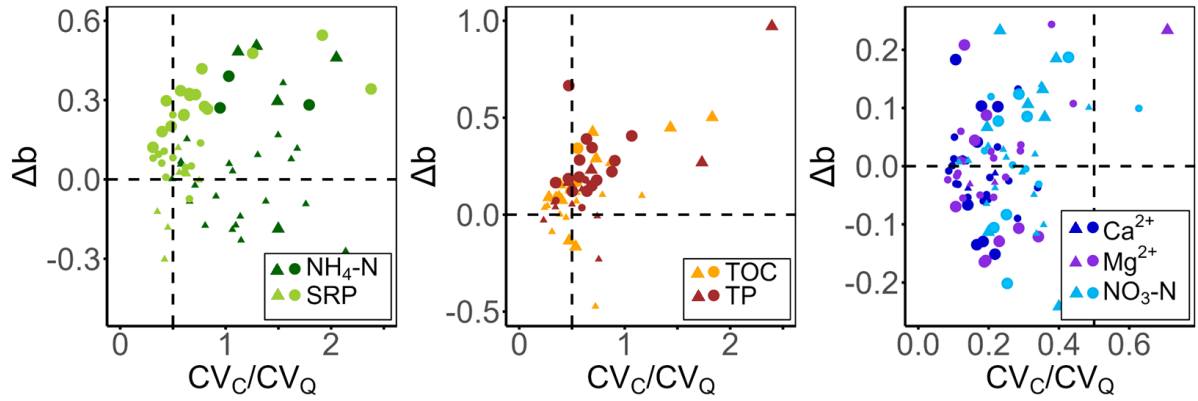

Figure 4: Change in cQ-relationships (Δb) for SRP, $\text{NH}_4\text{-N}$, TP, TOC, $\text{NO}_3\text{-N}$, Mg^{2+} , and Ca^{2+} explained by climate change. Positive Δb values indicate an increasing enrichment behaviour. \blacktriangle represent catchments exhibiting enrichment behaviour in Period 1, while \bullet indicate catchments with dilution behaviour in Period 1. Significant differences in slope b between Period 1 and Period 2 are highlighted by larger symbol sizes.

Table 2: Descriptive statistics of mean solute concentrations (C_{mean} , mg L^{-1}) and associated standard deviations ($C_{\text{mean}} \pm \text{SD}$) across all catchments. Interannual Trends in interannual solute concentrations are summarized as fraction of catchments (%) showing positive trends (C_{increase}), negative trends (C_{decrease}), or no significant trends (NC – no change). Trends were assessed using linear regression models (concentration vs. time), with p-values derived from F-tests and adjusted for multiple comparisons within each catchment dataset using the Benjamini–Hochberg procedure ($p < 0.05$). The number of catchments included in the analysis is denoted by n .

		$\text{NH}_4\text{-N}$ ($n=40$)	SRP ($n=40$)	TP ($n=38$)	TOC ($n=33$)	$\text{NO}_3\text{-N}$ ($n=40$)	Ca^{2+} ($n=40$)	Mg^{2+} ($n=40$)
$C_{\text{mean}} \pm \text{sd}$ (mg L^{-1})		0.15 ± 0.11	0.11 ± 0.05	0.19 ± 0.09	4.77 ± 1.45	4.04 ± 1.81	66.06 ± 41.48	17.08 ± 12.71
Fraction of catchments	C_{increase} (%)	2.5	0.0	2.6	15.2	2.5	15.0	12.5
	C_{decrease} (%)	57.5	67.5	60.5	6.1	72.5	5.0	2.5
	NC (%)	40.0	32.5	36.8	78.8	25.0	80.0	85.0

Table 3: Pearson Correlation test between catchment descriptors of different categories and slope b showing influence of catchment characteristics on SEM: highly significant positive correlation (++ p<0.01), significant positive correlation (+ p<0.05), significant negative correlation (- p<0.05), highly significant negative correlation (-- p<0.01). Moderate (grey, r>0.3) and strong (dark grey, r>0.5) effect sizes were observed, indicating varying strengths of association. Differences between correlations in Period 1 and 2 are determined by using ANCOVA (p<0.05) showing increased impact of control due to climate change (Δ), decreased impact of control due to climate change (∇), no change (O). Pearson Correlation is corrected by Benjamini-Hochberg correction.
