Response to reviews.

Again, we thank the reviewers for their efforts and their positive feedback. The only outstanding comment, from anonymous referee #1 was:

I only noticed that, although the authors responded positively to my comment on lines 25-29, the sentence was not modified in the revised manuscript.

Referring to their original comment:

Lines 25-29: In addition to theoretical models, ocean models and state estimates, the use of coupled models also helped to better understand feedback mechanisms between ocean and atmosphere. I encourage the author to discuss Swingedouw et al. (2007) for an overview of the AMOC feedback mechanisms.

We believe we had addressed this already, modifying the highlighted section to include the sentence:

Coupled models (e.g. Swingedouw et al., 2007; Böning et al., 2016; Weijer et al., 2020; Baker et al., 2023; Madan et al., 2023; Baker et al., 2025) help to better understand AMOC feedback mechanisms between ocean and atmosphere, generally predicting AMOC weakening during the twenty-first century, driven by freshwater input and reduced surface cooling – though results still vary widely.

We hope this is satisfactory.
