

Supplementary material

This file contains the supplementary figures noted “Supplement Fig. S1 to S8” in the main body of this paper.

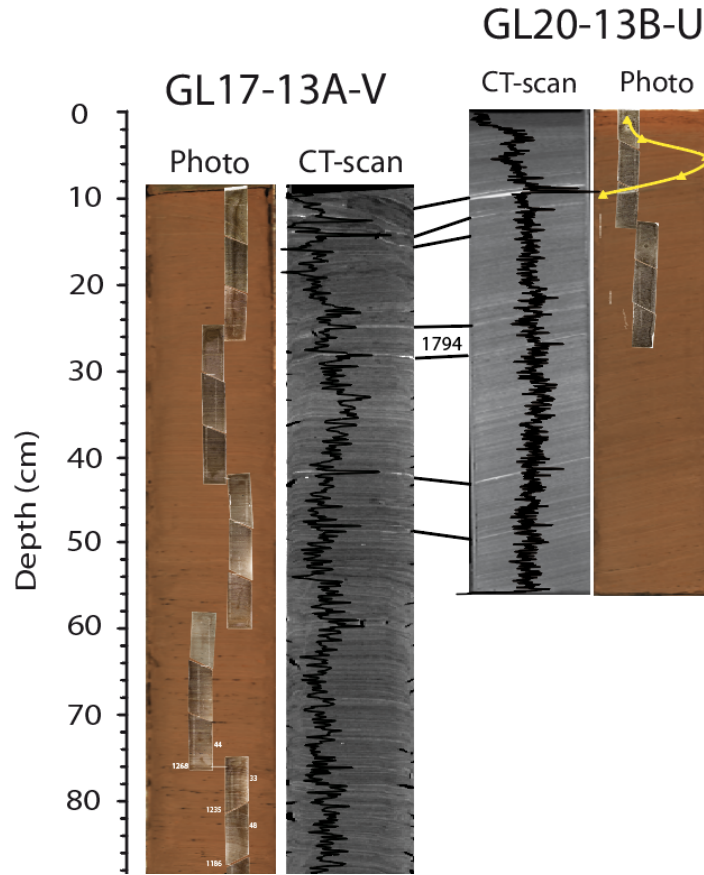

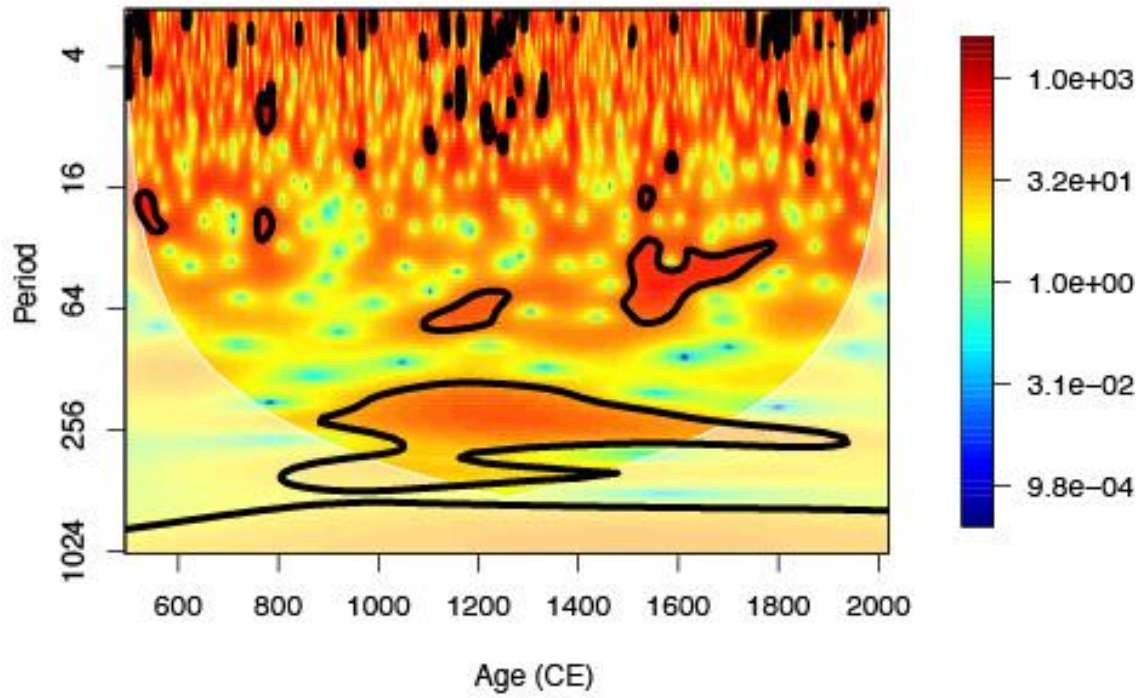

Figure S1. Photographs and CT-scans of the two cores GL-17-13A and GL20-13B. Black lines are the stratigraphic correlations between the two cores established using thick (coarse) distinctive laminations present in both cores. Photographs of the cores are overlapped with scans of thin sections made to counts and measure the varves in these sections. The yellow profile is ^{137}Cs activity variations.
