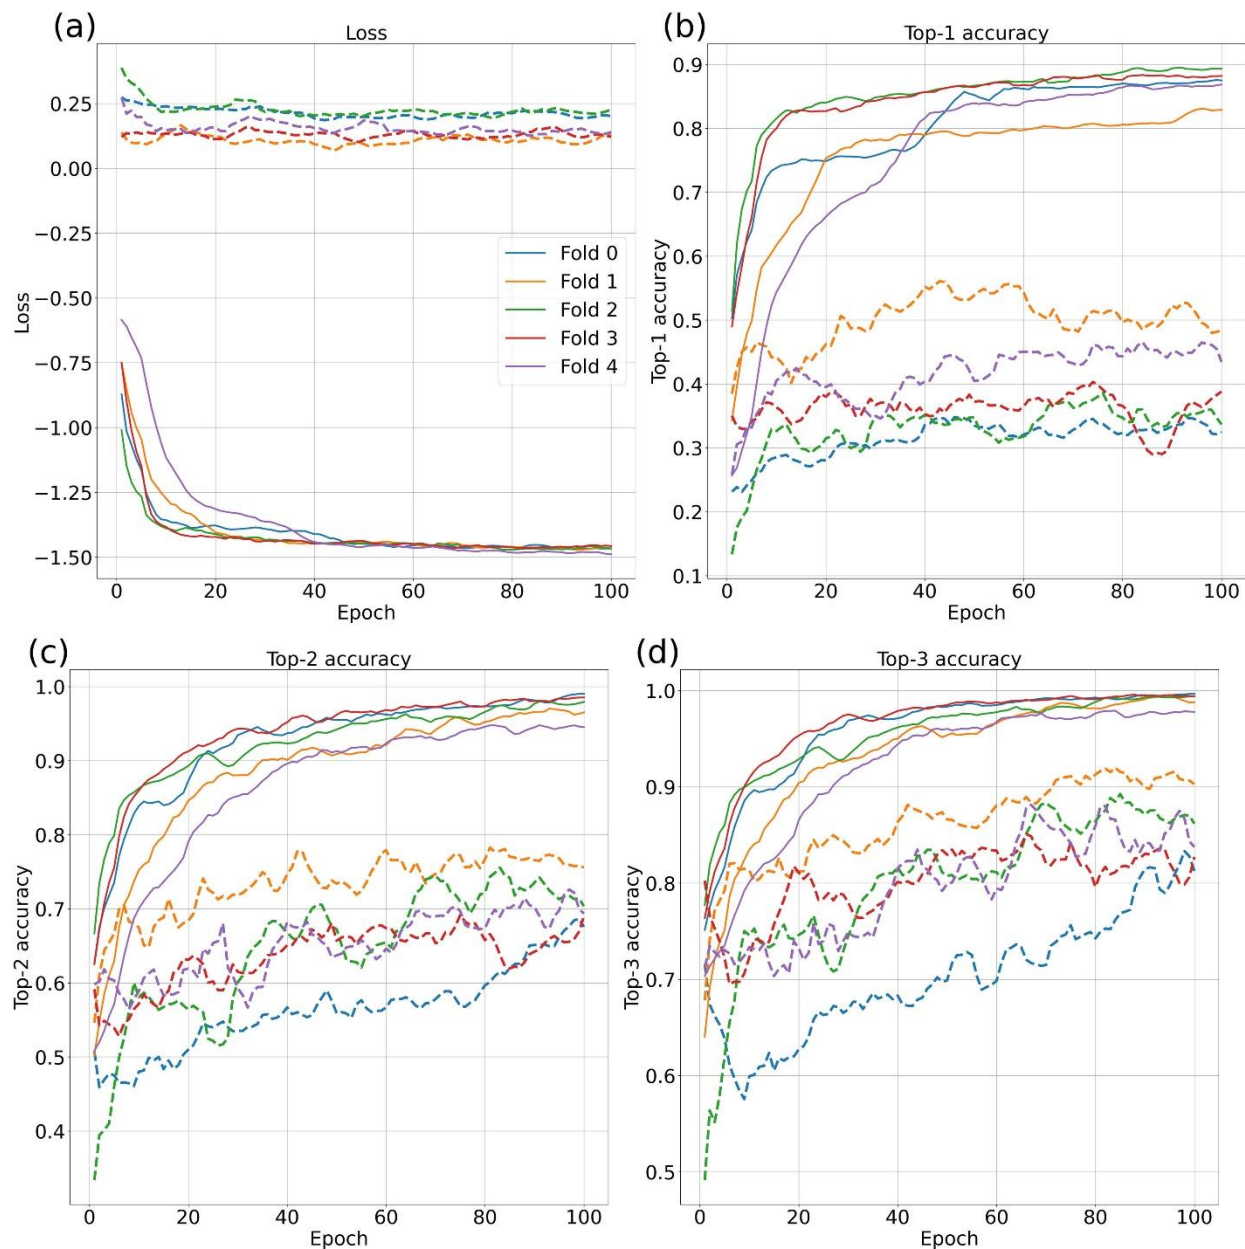

Figure 33. Learning curves for the six-class CNN model. Each panel shows the evolution of one performance metric over the 100 training epochs. Dashed (solid) lines represent the validation (training) data. Note that, because Keras expects the loss function to be negatively oriented (such that lower is better), the loss function here is actually the *negative* class-weighted Gerrity score.

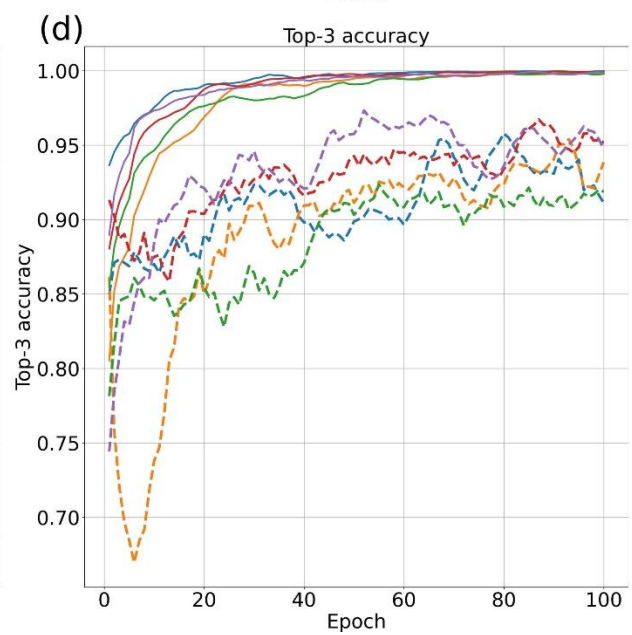

Figure 34. Learning curves for the four-class CNN model. Formatting is explained in the caption of Figure 33. Again, note that because Keras expects the loss function to be negatively oriented, the loss function here is actually the *negative* default Gerrity score.

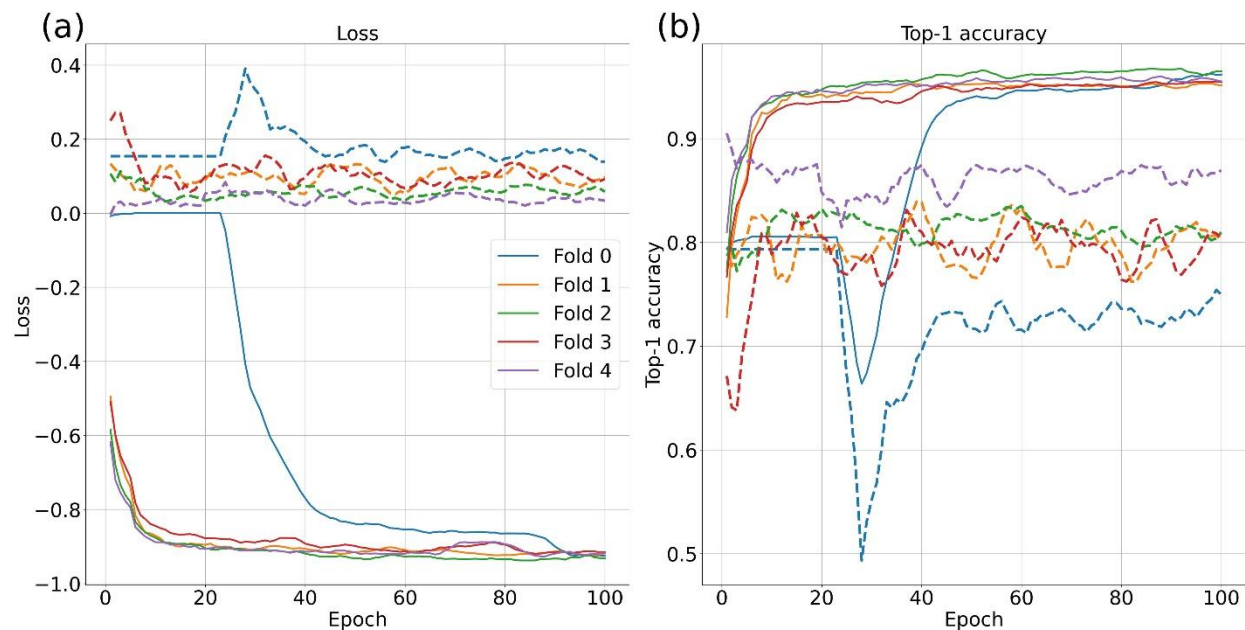

Figure 35. Learning curves for the two-class CNN model. Formatting is explained in the caption of Figure 33.

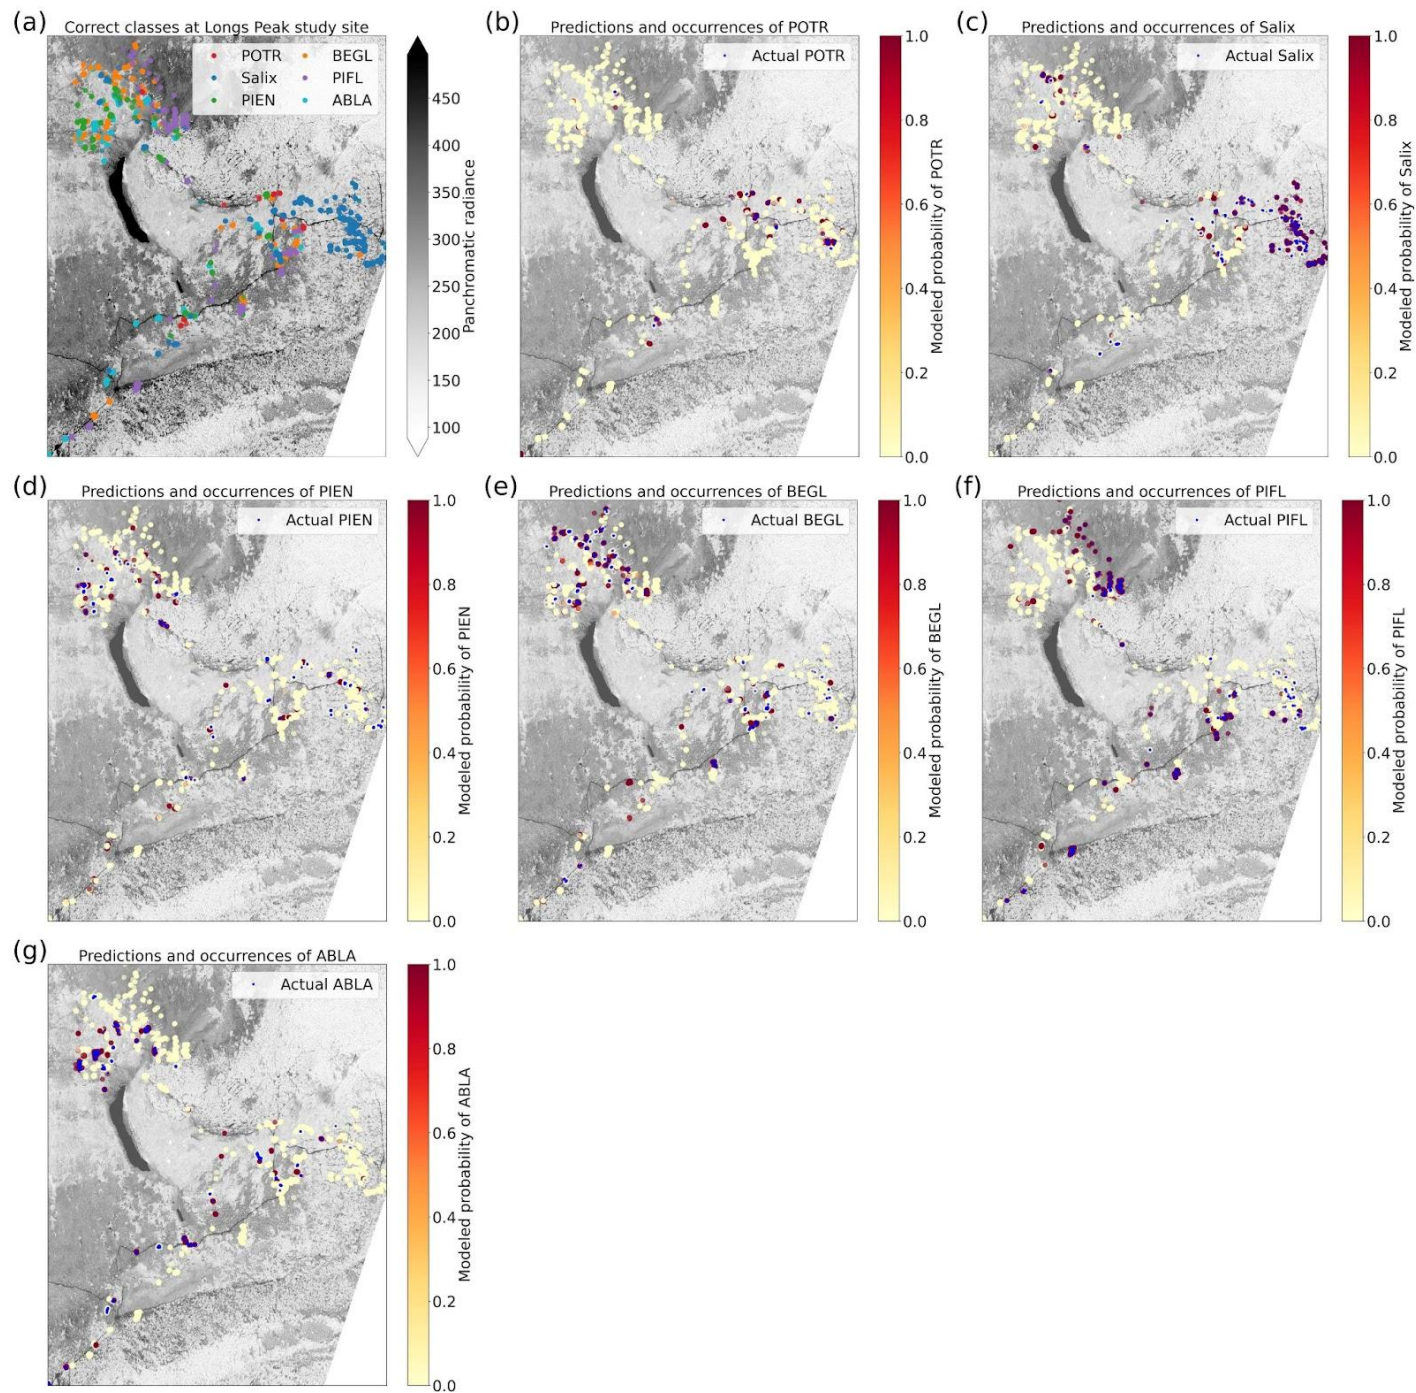

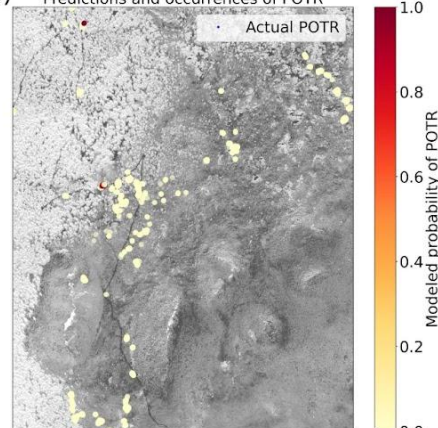

Figure 36. Targets and out-of-bag predictions for the 6-class model at the Longs Peak study site. [a] Targets (actual classes) with panchromatic radiance ($\text{W m}^{-2} \text{sr}^{-1} \mu\text{m}^{-1}$) plotted in the background. Panchromatic radiance is plotted at quarter resolution (1.24 m instead of 0.31 m), due to memory limitations. [b] Out-of-bag predictions and actual occurrences of POTR. For each data sample (one data sample = one polygon pixel, as in Table 1), the yellow-to-red marker shows the modeled probability that the data sample is POTR, while the presence of a blue marker indicates that the sample is actually POTR. Hence, faint yellow markers (probability ~ 0) with no blue marker on top can be considered true negatives; faint yellow markers with a blue marker can be considered false negatives; dark red markers (probability ~ 1) with a blue marker can be considered true positives; and dark red markers with no blue markers can be considered false positives. [c] Same as panel b but for Salix. [d] Same but for PIEN. [e] Same but for BEGL. [f] Same but for PIFL. [g] Same but for ABLA.

(a) Correct classes at Battle Mountain study site

(b) Predictions and occurrences of POTR

(c) Predictions and occurrences of Salix

(d) Predictions and occurrences of PIEN

(e) Predictions and occurrences of BEGL

(f) Predictions and occurrences of PIFL

(g) Predictions and occurrences of ABLA
