

The pH and available phosphorus as primary drivers of compost-induced CO₂ emissions from malaysian tropical soil: empirical relationships

Revision report (2nd revision)

I appreciated the detailed response prepared by the authors to my previous comments, and I consider that the quality of the manuscript has improved significantly following their revision.

After reading the authors' response, I consider that only a few points remain that could still be improved, as specified below.

Tables 2 – The authors refer that they included means and standard deviations to the table. However, if I'm not mistaken, the table still do not have that information.

Figure 5 – Some p-values are missing from Figure 5b. For consistency, I suggest adding them.

Table 3 – The legend simply states "Coefficients". Please add more information.
