

Review of the revised manuscript egosphere-2026-1628 “High Frequency of Urban New Particle Formation on the Tibetan Plateau: Quantifying Formation Rates, Growth Rates, and CCN Production” by Mo et al.

I have read the revised version of the manuscript, its supplement and the authors’ response to the review comments. In my opinion, all the issues raised by the reviewers have been carefully considered and corresponding modifications and additions have been made in the revised manuscript. As a result, the manuscript has been improved overall and is now ready for publication in Atmospheric Chemistry and Physics.
