**Figure S1.** •OH exposures derived from three different methods (SO<sub>2</sub> decay, toluene decay, and modeling). The experimental conditions of 1–9 correspond to one lamp illuminated with the residence time of 3.9 s (1), 15.8 s (2), 27.5 s (3), 39.3 s (4), and 51.0 s (5), and to 2 (6), 4 (7), 6 (8), and 8 (9) lamps illuminated with the residence time of 51.0 s.

**Figure S2.** Photon fluxes estimated by the model with different lamps illuminated (up to 8).

**Figure S3.** Comparison of the decay of SO<sub>2</sub> and O<sub>3</sub> measured in the OFR and simulated by the model. The experimental conditions of 0–9 correspond to no lamp illuminated (0), one lamp illuminated with the residence time of 3.9 s (1), 15.8 s (2), 27.5 s (3), 39.3 s (4), and 51.0 s (5), and to 2 (6), 4 (7), 6 (8), and 8 (9) lamps illuminated with the residence time of 51.0 s.
